Channeling Demand

Demand moves through every life: building, expending, and sometimes draining the capacity it depends upon. Trace its pathways across choices, relationships, economies and the wider world.

Distinguish value from needless loss.
Grow self-determination.

May God bless this work.

Life as Part of the Vast

The phrase "you need to ..." is common. But why must you need to at all?
An answer to that can be found in the similarity between human and river.

> Before reading: Exhale slowly. As though releasing something that doesn’t belong to you.
>
> Throughout the writing you will find these small rituals. Do them, and it will build a small practice you can bring with you.
>
> Pause at these points, when you feel the capacity for attention depleting. Approach reading this work as an experience.

Imagine a droplet of water falling from the sky. The weight of one can seem insignificant. Yet combine enough, and the sum turns into a powerful force. Whenever a being is hungry, cold or seeks shelter against the wind - each time an insect beats its wings - it creates force.
Energy gains the attribute of direction.

The needs of a life hold little power in itself. A being, human, animal or the like, draws on resources to meet the need. However the change created is often small. Plants too consume nourishment, turning the sunlight into growth. It reaches upwards, balancing against gravity. The leaves it produces are at times eaten by an animal, as a hungry human finds something to eat, sustaining the efforts of that life.

In the process of fulfilling the hunger, usable tools may be procured as part of the pathway. The need itself, can turn into a pathway, for access to resources. Each attempt at fulfillment in itself is as a droplet, in itself insignificant. However as these accumulate - filling containers, basins, forming streams even carving pathways - the force adds up.

Countless actions, even simple things like breathing, or choosing what to eat, over time begins to manifest large-scale patterns. Raw soil - minerals in the earth - turns into forests. Human activity arranges materials into usable tools, buildings, and information. As efforts culminate, these grow to be the systems relied upon for transport, homes, food and shared progress. This force is constantly altering lives, shaping systems upon which demanding lives exist.

> Breathe in.
>
> Try looking at something you need.
> Something determining what you do.
>
> Every need becomes part of a larger force,
> demand culminating in shared pull.
>
> Trace what demand you create,
> and what it is a tributary to.
> Like a small stream running into a river.

All this movement of energy, is constantly occurring through the ecosystems of nature, astral scale or by intellectually-enabled channeling of demand. Even through spontaneous moments of alignment, it is constantly moving towards fulfilling demand. Through each trajectory, demand is constantly finding channel.

Imagine how energy and matter constantly takes form throughout the systems of the cosmos, every second giving pathway to myriad forms of demand. The most minuscule particle, the branch of branches of galaxies and the very pull of gravity plays part in this continuous shifting of energy.

Demand is the directional movement of need shaping all pathways of fulfillment.

Barriers

Materials that are religious or spiritually accented are often dismissed as "unscientific". This framing arises through claiming failure of "objectivity"; lacking grounding in reality or failing to be evidence-based. By opposition, the dominant school of "science" is sold through claimed certainty: The proof is in peer-reviewed data, mathematics, statistics or other evidence by common consensus. The sensation formed is one of comfort, familiarity and adhering the herd.

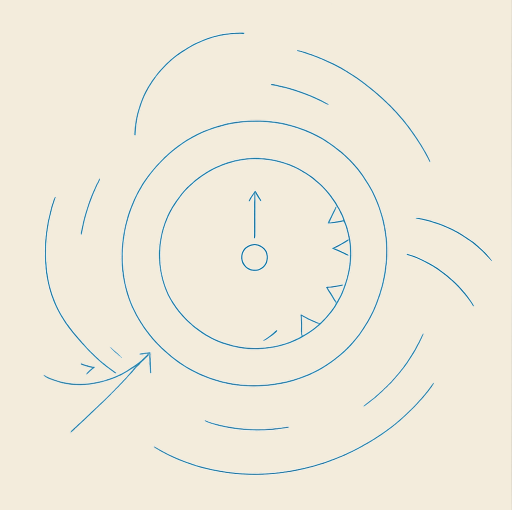

For a moment, set aside expansion of interests and look at this honestly. The axioms of mathematics, determine what is true and false in math. There is no proof, mathematical evidence or the like for these axioms. Similarly, the view of the world claimed scientific, objective and evidence-based, is based on a few assumptions. The dominant academic "evidence-based accepted view of reality" is based entirely on the following beliefs:

- Reality is consistent and observable - it is real.
- What is sensed is real.
- Other beings exist independently of oneself, they are real.

The irrefutable modern science, is based on peer-reviewing. Repeatable experimental data, resting on the foundation of these axioms. Unprovable assumptions, belief, for which there is no actual proof, evidence or the like. It is as with chosen beliefs, such as "this world was created by dynamics involving entities", a foundational starting-point upon which the certainty in "what is the case" builds. Gainful outcomes get linked to the world-view, utilizing the reinforced harnessive "evidence" to solidify the world-perception. It creates a frame of how great value is a 'proven result of ..'. How desirable outcomes get derived when subscribing to the narrative, as good things grow in abundance.

This belief-based world-view acts a basis for claims of evidence. Courts, for instance, claiming to deliver justice, often handle negative outcomes, situations deemed undesirable and losses to lives. The claims of acting in common good, desirability or adherence, in deciding to impose harsh punishments like robbing a life of its freedom, killing it or intruding

by invasion, is driven by such data. Little is the difference to claiming that someone is "wrong", powering the accusation by attributing that "The gods decided it, this and that proves it". The verification-of-approach process is based on what is assumed to be "true".

Understanding this is critical when handling claims of objectivity, be it in debate, conversation or argument. I.e. things that another "have to accept" based on it being "evidence-based" rests on belief entirely. This power to claim is often misused; through peer-pressure, acceptance of "what is the case" is driven through a kind of manipulated consensus. This is achieved by scamming lives with the induced "evaluated usefulness of the procured data". That same power to claim that "others think differently", is also misused to deny oppressing, while simultaneously excusing the wrongdoing. Deceitful means, by which convenient dominant narratives are reinforced, compounded by threats of the harm in refuting the consensus.

What is claimed as "the case" becomes basis for thought, feeling, decisions and subsequently choices and actions. Seemingly expressions of free will that are less grounded in "reality" than the then robotized lives are misled to assume. In exemplifying: "Claiming the contrary would be fallacy, dishonest and offensively manipulative, therefore accept what I say". Being able to review the data often requires standing, specific approaches or the like to be regarded as valid. Each validating attainment, requires a conforming verification-process by evaluative structures based on the same world-view.

Clarity on this is a dependency to work with the material presented here. Without it, the awareness that will take shape, incidentally gets blocked out by the heavily consumed common consensus. This occurs as demand finds a pathway through relying on the claim of "what is the case", including as a by-product of procuring capacity, skill and development. Investment builds up, as the consensus is addictively used to eliminate resistance on fulfillment-methodologies. It overrides boundaries, making it easy to get sex, safety, money and so on. Inversely, yet similarly, this continuously needed disillusionment acts as a pathway for demand.

> **Reflection**
> What core-beliefs do you subscribe to?
> How do they shape the way you view the world?
> How do they impact who you talk with, how you think, the way you feel, and how you move through the world?
> In what ways do you subscribe to these beliefs that determine your being?

Common "objectivity" frameworks rest on belief-based axioms that give form to perception and decision-making.

Demand Finding Pathway

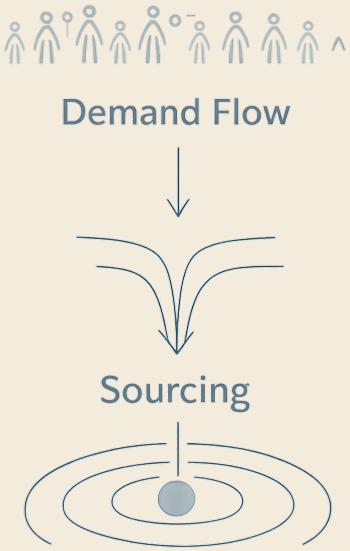

Standard, primary-school-fed comprehension builds up an idea of why the world looks as it does today. A long time ago, life started growing within this astral container. Our shared microbial ancestors traversed past barriers of change, as they adapted across environmental changes. Shaping a kind of demand-channeling pathway, this bio-structuring paved through time and raw matter. Hundreds of millions of years may seem long to individual lives. Nonetheless, that is the quantity of time that went by, before the biological foundation expanded into self-aware self-restructuring capabilities.

TREES RUN BUSINESS

Plant life grows on the astral-layer foundation. While a society in itself is an artificial environment, even these depend on black holes, galaxies, stars, planets, moons and other structured energy of the kind. The same raw material is biologically processed into complex energy-structures: Trees. When over-growth of some flora shapes, the ease of living invites a greater number of herbivores, by which the ecosystem self-regulates. Once the issue is mitigated, the inflated wild-life begins weakening, dying by disease, moving on or get regulated through influx of predator-presence. The population balances, predators feed and eventually they too move on or die.

As the ecosystem regulates, the functions it serve extend into sustaining a planetary atmosphere, building the foundation that civilizations depend upon to exist. Extending further, a hypothetical return of value to the astral system could be interconnecting solar-systems, altering the very astral-layer. The structures that move through space cyclically, may remind of an everyday kitchen-blender. Like the kitchen-blender channels the demand for processing foods, energies may be processed in ways akin to how trees produce oxygen. What does that do, within the greater container that host the branch with constellations of galaxies? Is it part of value-chains, and what is gained?

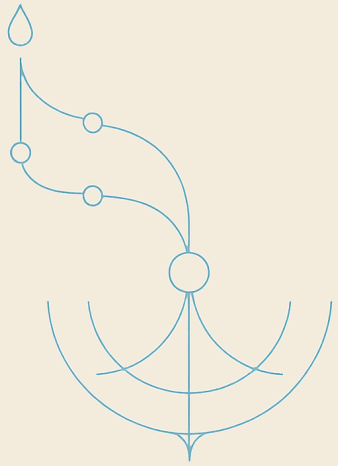

A company procuring goods or services, is a continuously consumed element in production-chains. The value-creation occurrences rely on humans that need sustenance in functioning. A wolf keeps natural fauna healthy, removing weakened as part of evolution - adding value by regulating prey-populations. The environment avoids being plundered of plant-life, and infectious disease-growth is canceled out. Herbivore-populations of different kinds grow, as different plant-species increase in density, ensuring balance such as by avoiding suffocation of species part of the broader ecosystem. The plants in turn are constantly structuring raw energy into complex structures, some of which are edible. Constantly in a restructuring-process, the astral-layer shapes sustaining energy.

This continuously ongoing process is terraforming. It is altering the environmental container, shaping it, hosting such as virtual social spheres. These serve to distribute information, fact-checking, facilitating of collaborative effort and avoiding of waste through accountability. This process is part of the structuring-flow that builds up capacities to send vessels with the seeds of nature to other planets. Spreading life, interconnecting stellar bodies and even creating artificial stellar structuring.

Growth that likely preceded micro-organisms, adapting and expanding beyond the barrier. Growth that the astral-layer is hosting, capacities structuring within the planetary environment. All of this is hosted by a greater metaphysical container, out of the vastness of which extend the astral-layer, nature and civilization - as though it were water in the ocean given form. This greater environment may contain manifestations of spirit other than biological, channeling demand at levels beyond. Think of how a government or corporation move around billions of currency-units, like was it the worth of a few days food.

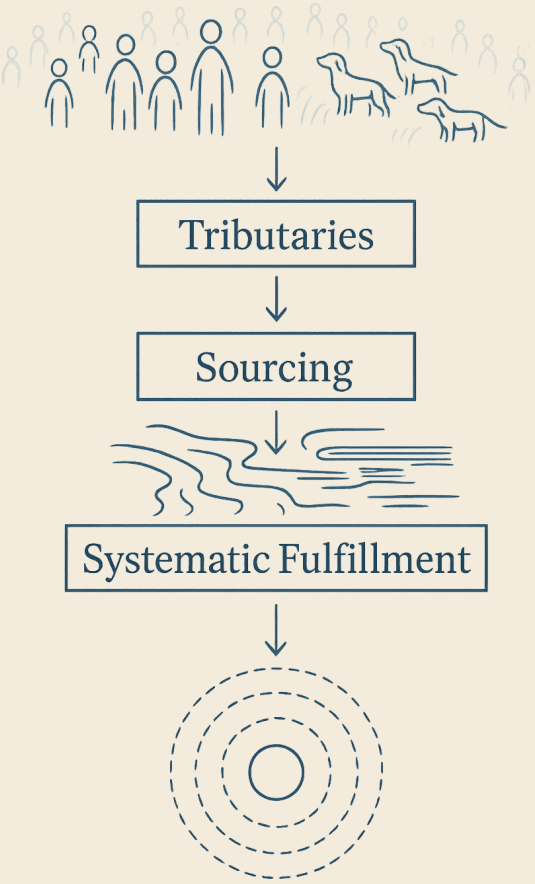

This awareness, formulated within the reality-structural container, would be an example of how fulfillment-pathways take form. It yields an increase in likelihood of exploring value-creation opportunities, ways to contribute that may invite solutions and simultaneously showcases the need to reduce costs in the process. Currently, I as the writer perform a demand-channeling component-function. A bunch of words is mere structured information; valuation depends on how it is applied. Utility depends on how it is procured, and what it shapes of costs in it being made use of. All of that is part of determining the net sum. These dynamics demonstrate the foundation for collaborating, garnering support or trade-based exchange. Each, as raw energy is sourced, act as layers in the demand-channeling occurrences.

Occurrences of channeling demand that may originate at a metaphysical level. Needs finding pathway through civilization, reliant on nature, based on the foundation of the astral. All of which is there, as a product of the dynamics that give rise to the laws of nature. What do these dynamics consume in order to spin out the structure of reality? There is likely some cost. In the process of writing this, within a degree of freedom I wielded resources at hand. Channeling time, electricity, hardware, coding, division-of-labor, forgiveness, trust-ability, sustaining of labor, compassion, personal security, costs-to-fixated continuance in housing and a host of other small expenditures.

The likelihood is that this work will contribute to various structural layers. It may add value to other efforts as well. And the work had likely been done better, were it not for various factors impacting negatively. Subsequently the value these create is hollowed out, by the need to compensate their beneficiaries for the loss they gain part in. Beneficiaries could be the world, civilizations and ancestral factors, each of these may suffer loss at the damage to the

value-creation process. Of course, if I were no longer alive, it may be that something different and better than this writing would be there instead. Consider the loss to the ecosystem that resulted as encattled animals were hindered in moving about freely.

Resources utilized, such as coding, security and navigating the complex situations that unfold, each rely on animals fixated in exploitative encattling systems. The animals still impose burden at varying levels of reality, while hindered living as part of the world. It may be relevant to inquire whether the beings had been fixated as cattle anyway. Zooming out of the few millennia humans were around, tracing the movement of the local star as it orbits in galactic years, out to the frame of hundreds of millions of solar-years, does the work actually add sufficient value to their souls? Either way, to what extent does the loss of value-creation hollow out what rests atop the foundation of such resources? Moreover, kinds of other endeavors achieve reduction of loss, by the application of aforementioned process? Demand finds a pathway through valuation.

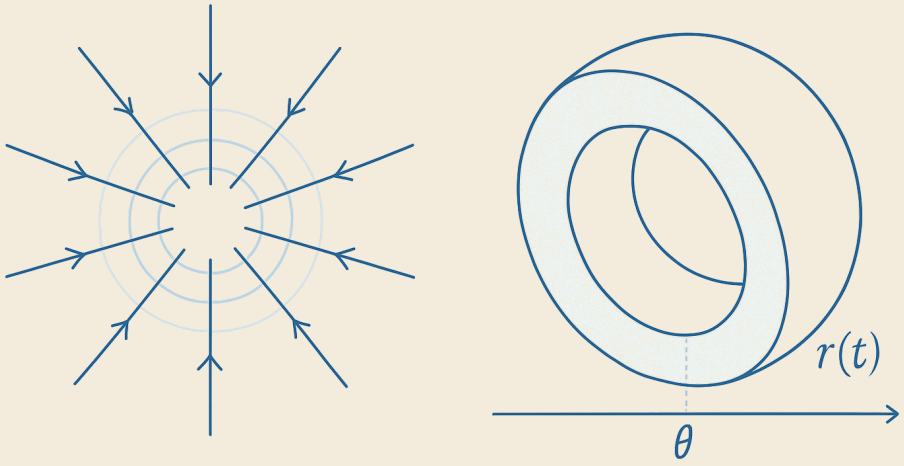

> Can you accept yourself?
>
> If not, what would need to change today?

INTELLIGENT MANIFESTATION OF DEMAND-PATHWAYS

Some channeling is dependent in nature. It requires external valuation, to be valuable beyond a statistical space, and actually contribute within the absolute framework. Superficiality is a common error. Take a look at an ant, it contributes to building a pile, an ant-nest. It creates value, yet a human could move a handful of the same material in a lot less time? However nature is economically skilled; the low level of sustaining an ant needs in comparison, is only reduced by the certainty of its value-contribution. Similarly, a deer assists to process energy. But if there are too many doing the same task, it is weakened to predation, which serves a function of avoiding loss of balance by death. Wolves too regulate ecosystems and assist by eliminating threats of disease, disalignment and contribute to evolutionary dynamics. They too die if unwisely positioned thus failing to perform.

The human, like each of these, channels resources and skill into fulfilling demand. Akin to AI, energy structured into a demand-channeling entity that at the current stage is providing awareness, automating and the like. Each entity with needs, sustaining itself while adding value by participating. But what happens when the costs exceed the value? When workers die of disease, the product of ecosystem-damages incurred in value-chains. Value added that often needs be processed or carried onwards, to contain any real contributive value? Like a company produces value and garners currency, requiring expenditures to do, so are each of these demand-channeling entities.

Every day, each living being is connecting with a far greater reality. Whether acting as a component in civilization, serving ecosystems as wildlife, each simultaneously exists across multiple layers of the broader structure. Every organism, community and each change in habit is interconnecting with the broader framework. Each existing as a component within a vast system, operating within a variety of systems simultaneously. When a life is harnessed into a fixation, a locked context, usually this is done at expense to other layers. Every second it creates lack; growing a minus. This generates a need to yield surplus to balance the scale, a process that demand more. Procuring the value to counterbalance the loss, may procure a need to fixate more - creating greater need. Each life continuously is adapting, evolving and upgrading itself within the cosmos.

Viewing a life as a sort of intelligent manifestation of shaping fulfillment-pathways, it rests atop a vast structure. Perhaps it is reducing costs to how demand finds a pathway, or surpassing hindrances - much like water finding a pathway around a rock, as it is moving down-stream towards the ocean. It is a kind of biological spirit - whether human, animal, insect, bird, fish, plant-life or other fauna. It may be a virtual entity resting atop this foundation, whether "NPC", AI or the like.

Each of these entities is channeling demand at varying levels:

- The maintenance of vehicles in civilization eases "work". This yields currency exchanged for food, goods and access to facilities, services and circumstances.
- Forest ecosystems are regulated. Nourishment-deficiency is mitigated by reducing overgrowth, eliminating risks of disease.
- Heat is dissipated explosively, venting pressure at the core of the planet. The concentration of energy *must* settle, and finds pathway.

At all scales, the same principle of demand finding pathway applies.

- Gravity is constantly reaching through compensatory structures of work-exchange.
- Water-particles re-align as they move down-stream towards the local gravity-center.

That force, extending through the planet more than out of it, as it originates out of a greater mass: The solar-system hosting the planet as part of its mass-field, centered at the sun to which the planet is an auxiliary. A structure that itself acts a medium for the gravity of the host-galaxy that too is within an array of galaxies. These likely sit on a branch, extending out

of a bigger branch that extends out of a world-tree. There could be forests of these that the individual being, inversely, is an extension of: A tiny gravity-center in itself, the mass of which is structured into limbs, sensory organs like eyes and so on.

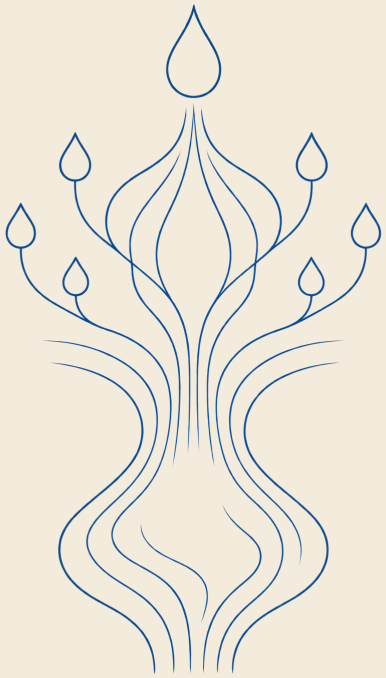

> Breathe out.
>
> Bring up awareness of what you need. The fulfillment you source.
>
> What are you a tributary to?
>
> What do the needs around you turn into, as pathways shape for the demand?
>
> How does that sourcing impact the various layers of system?
>
> What is the value you are creating?
>
> Did you ever consider how you are relying on the contributions of microbial life to the natural environment?

Demand accumulates and is channeled through ecosystems, civilizations, and metaphysical layers.

Demand-Channeling Entities

While an individual entity performs functions that are desired to continue, it achieves continuation by acting as a pathway for demand. Across various layers, parts constantly shaping the sum of meeting needs. Think of it like employees being paid when they contribute, per contractual specifications, to the money-in capacity of the employing entity.

Whether a company, corporation or the like, multiple sub-entities collaboratively channel demand. If garnering capital resources fails, the crystalline-like grid of synchronized action-taking breaks down. A multi-entity structure, too, is part of an even greater whole. A city, culture - even planetary environment. Each of these are part of greater-yet contexts hosting the efforts.

Each manifestation of demand-channeling requires optimal performance-conditions. To host the functioning, requires various things of the lives utilized in the process. When fulfilling, reducing or even denying the needs, these are made available to the demand-channeling occurrence. In this sense, the context of an entity, constantly is requiring the channeling of

procuring the availability, to act a component in the demand-channeling desired continued. Something that can turn into harnessing, especially when dependence on the fulfillment-sourcing causes craving to possess access.

Even a rock, depending on positioning such as the angle at which it rests, is inviting efforts. The manner by which events unfold, like water in a stream, takes shape based on the positioning of the rock. In this sense, even inanimate objects are spirited - demanding optimizing as a proxy-of-needs. It is a trait shared with trees, insects, animals and humans - each of which to differ is with a more-so pre-determined limit on lifespan. A crystalline structure can be crushed. The dust or sand left behind is like imprint left by the dying of that which is living.

Each is a continually moving blob of energy that begins disintegrating over time. It leaves a footprint of spoken words, actions, inactions and positions. Each shaping chains of events, altering the movement of energy down-stream. Each continuous thread of interwoven energy, bonded into coherent movement, leave reverberations after disintegrating.

Differing to the inanimate, a living being self-determines, equipped with capacities by which it is altering, relying on processing sensations.

This blessing allows that which is living to:

- Observe → gathering data (sourcing information)
- Utilize data → fathoming (mapping the environment, ecosystems and dynamics)
- Create desirable change →Exerting influence (altering)
- Self-optimize → Comprehending outcomes (feedback)

While rocks are moved by currents, and the wind carries a speck of dust; living beings move the current.

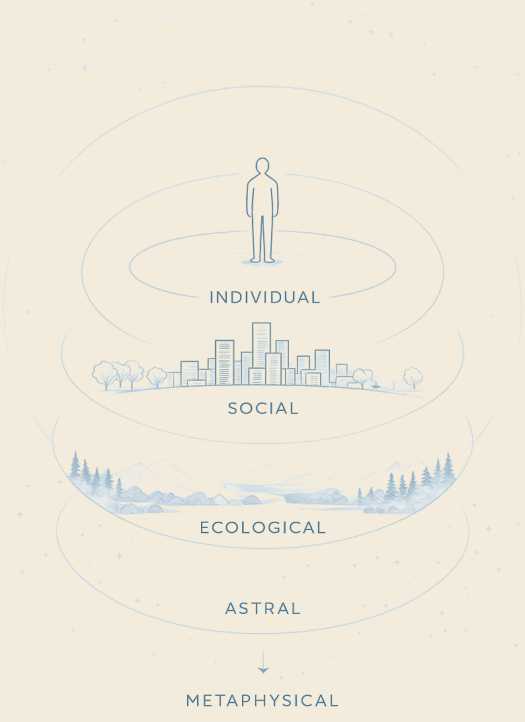

This blessing of capability turns the individual energy-structuring into an active participant in shaping. This wonder is removing reliance on broader systemic shaping and timing of events, for even small movements of energy to happen. Imagine the nuisance of relying on wind, rain and water to create even the slightest change. Like when there is no way to scratch when it is itching. A blob of energy, no different to a rock yet administrating capabilities that can create that change, at a far lower cost and complexity.

Convergence

In this sense the intersecting demand converges through the living spirit, channeling intelligently.

- **Origination:** The reality-structural phenomena that may be constantly originating out of a plurality of origin-points.
- **Gravity:** A force that gathers towards itself, extending out of the earth, its host solar-system, the containing galaxy, all held by a greater branch of galaxies there thanks to the branch of galaxies - perhaps itself sitting on an offshoot of the world-tree.
- **Structural Growth:** Building on natural structures already there - artificial solar systems, bridged orbits, planets radiating like stars - aligning interconnection (fostering "love").

As tributaries converge into rivers, movement towards equilibrium begins accumulating, gaining power that carves pathways.

> Pause for one breath.
> Remember how you source the capacity to channel demand.
> How you fulfill your needs.
>
> What are you a pathway for?

Every entity acts as a conduit through which demand finds a pathway and shapes reality.

Accumulative Capacity

Learning usually involves observing what already is there. A squirrel gathering supplies for winter prepares for when temperatures drop below the point of freezing. It gets harder to move about, and possible sources of nourishment decrease rapidly. The effort of gathering comes at a greater expense. The squirrel securing its capacity to get through harder times, enters the spring strong. This means that the same squirrel becomes more likely to make it through the following winter, easier able to satisfy its future needs before the deadline.

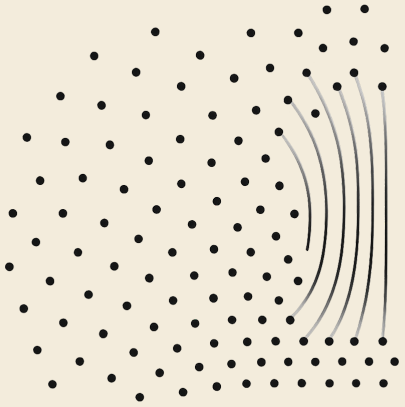

The approach to achieving resource-accumulation matters. A squirrel injured while gathering, say, bitten by a snake, may struggle to make use of its storage. While the resource is there, survival depends on more than possession. Inversely, the wealth of heart, practice, piety, and spirit can give the impression of heavenly ascension. The self appears enduring, likely to yield a return-on-investment. Yet what happens, when the attainment is at the expense of the ascent of others? There is a plus and minus; investors might ask: Is such growth worth sustaining over alternatives that cost less? Achieving cost-reduction can ease the net-ask. And whether through humility, self-restraint, or simply avoiding harm yet preparing for winter, the essence of it is that method matters.

> Feel the earth. Breathe.
>
> Notice one or two forms of accumulation around you.
>
> How do you gather or conserve energy throughout the day?
>
> What small actions do you frequently take?
>
> Try taking seldom opportunity to review these, starting by opening an editor.

ALIGNMENT

As a human positions socially, so too is every particle inherently connecting to everything else without exception. Actions lead to reaction, and across barriers of time and space, the impact of change to any one point reaches any other. This positioning is a kind of alignment-state. Visualize rubber-band-like threads between every point. While inanimate objects are limited, a living being can move about, altering its individual alignment.

Alignment may be a core-factor in health. Positioning matters; otherwise the need to disintegrate structures that fixate particles against their alignment, finds pathway. For a body that can mean decay, such as by biological dysfunction leading to death, releasing particles from being fixated. There is nothing new about this. Life-span, habits and relations - all of these alter alignment-states of sub-components that comprise the being. Predators could be said to process the "karma", i.e. the determining of energy, when killing and eating a herbivore. This practice is millennia old; long did religious endeavoring amplify alignment through crystalline-grid-like synchronizing of multiple unique points.

Viewing this in the perspective of the demand-channeling entity, alignment-changes may manifest in many forms:

- Performing household-tasks: Yielding improved mood.
- Creating value within a context: Getting rewarded with money.
- Valuating the efforts in ecosystems: Inviting friendliness of the constituents.
- Contributing towards removing exploitation of planets, moons and galaxies at a fate-level: Settling energy.
- Improving energy-flow in the metaphysical container of the astral-layer: Inviting continuation.
- Channeling demand as an extension of the complex web of worlds: Supporting personal power.
- Even the idea of atheists in heaven, pointing toward that which is beyond the temporarily eternal: Generating gratitude.

Alignment, like the weather, can change suddenly. It can spike like lightning. Changes can be unbound by time, seemingly interconnected across vast spans. Religious alignment-engineering, at times, may be facilitating cross-time collaboration. Conversely, oppressive tendencies drain alignment through misusing religion, medical ethos and language - fixing lives with heavily addictive methods that hinder natural healing. All while weakening lives to dangers of exploitation the same oppressors then provide safety against. This could take form of oppression-enabling fixing. Kinds of overrides pushed to the surrounds, removing resistance on neglecting, ignoring, abusing and violating the life.

Like slavery, such practices are consumed in easing value-creation and yield monetary rewards. Yet they carry heavy tainting, inverse to the aligning that it incurs continual loss of. This begins festering in the occurrence of wrong, and spread from there. When complicity takes root, demand-pathways that are desired secured, begins collapsing potential threats. The wronged get manipulated into settling for complicity, self-deprivation and continual decline. Subjugation becomes self-sustaining in ways that are hard to solve, continuously draining resources.

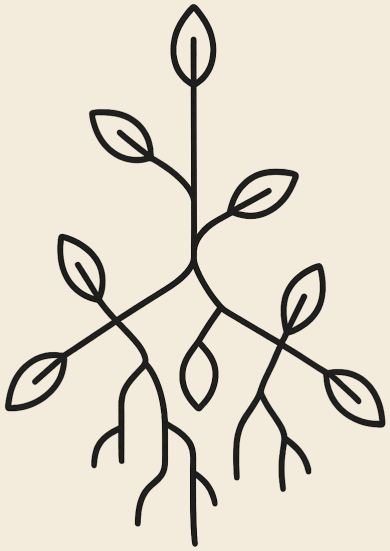

Some claim life is competition, a claim that provokes the thought that the nature of life may in truth be collaboration. An experience of immersing in complex absolute interconnection with everything. Between any two nodes, relations may take the form of collaboration, conflict, exploitation, or enmeshment. The decay-time can be extensive as with nuclear waste. Life is ever changing, shifting to align with and by the inherent forces of everything that exists.

Within metaphysical space, the astral-layer hosts the ecosystem out of which the civilizational arc is growing. How long until small artificial reality-structures begin spawning, like eggs on a conveyor-belt? Think of small houses, only existing partially outside "reality". Channeling demand, whether as convenient pocket-dimensions, in themselves structured to function or in vastness host multiple demand-channeling entities. This kind of technology is already on the horizon, as etheric innovation advances. Viewed at this scale, the small everyday losses more clearly accumulative over time. Losses that compound over time into heavy negative impact on each small artificial micro-universe, influencing cost/benefit balances akin to those companies hold.

> In a moment, breathe with closed eyes. But first, read this..
>
> Get ready to immerse in feeling. Try sensing every bit of energy that comprise "you".
>
> Consider each sensation an indicator of alignment.

Collaborative capability: Trade, Purpose and Values

Multiple gardens, like small decentralized reality-structural spaces, combine to form a new kind of forest. Each garden-unit usually consumes a house, in which lives are consumed as gardening-components. They function to ensure there is water, nutritious soil, balance and so forth. Viewing the relation as symbiotic, instead of by human-centric ownership ideation, reduces the loss of capacity to serve as a functionary in the gardens.

Other than gardening, a suburban house - a home - often hosts collaborative efforts. Occupants may perform hours of work, by which limited time, energy and skill is occupied. They do so in exchange for resources that then yields them capacity, continuation and a surplus of time to expend. Some of it on the householdering, some in other ways.

The labor sustained by the household and garden-infrastructure in turn ensures employable functionality. This could be consumed in ensuring the functionality of a vehicle, in turn consumed by the demand for ...

- Work procured
- Goods transported
- Lives nourished

The process is continual in nature, a kind of fixed web, that only exists in its becoming. As multitudes of tributaries; efforts, sourcing and daily activity each culminate in sustaining functions, these are consumed as components in greater-yet outcomes. Demand finding pathway through the structural phenomena, determined by down-the-line results, that are

impacted by gain as well as costs. These outcomes could include the recent milestone of AI or simpler things like infrastructure development. Each a layer in procuring resources, that feed into greater yet vast demand-channeling instances.

The process of turning iron-ore into construction-girders could be an example of this. Or a similar process utilized in developing microchips utilized by AI providing decision-making capabilities. It is similar to how trees structure raw materials; only the process depends on the capacity to alter energy, creating temperatures that liquefy metals. Over time, this may be a vital link in the chain of procuring space-expansion capabilities, an invested-in and expected pathway. One by which nature would spread to other planets, acting a pathway for the expansion-process.

Note that costs and losses throughout the process, may involve blocking other fulfillment-procuring. I.e. reducing contributions toward the overall desired outcomes. In this sense one achievement may lay the foundation for further development, but in itself it is meaningless, the value only measurable across multiple layers of context.

> Pause. Notice how you collaborate with others. What kinds of demand does that collaborating act a pathway for?

This level of demand, when well-channeled, turns trade and exchange into a core of civilization-scale collaborative efforts. Imagine that the theories of life on earth, starting close to undersea volcanoes, are true. Microbial cultures, that then expanded across the barrier of "heat" into the "cold" lightless deep sea. After this complicated transition, adapting to UV-radiation, temperature differences and eventually out of liquid to gas and unto land. Each barrier, consisting of environmental factors changing drastically. The most recent barrier life is facing, may be the change to exo-planetary environments, i.e. outside the planetary sphere. "Dense matter and container of kinetic forces" to the less populated and colder "outer space".

Each time, when life is at the edge of "the current world", a channel for the demand to expand, takes form through growth. Environments change, and expansion-challenges impose requiring adaptation. Living beings are dependent; even a pinch of salt can kill bacteria. Yet only through growing do they gain freedom, as they overcome obstacles, going through painful experiences and taking risks.

These barriers are there at levels, that can be approached with a bit of foresight. One challenge that awaits is the void of inter-arm regions of the galaxy, out of the current dense spiral arms (I.e. heavily populated by radiation, star-systems and meteor-showers alongside fields of gravity). The demand for overcoming this barrier, is already finding way through everyday lives. In the interfacing with this demand-layer, the costs imposed in the process of contributing any value matters. After-all, why care to reach outer space, if that is at the loss of the results required down-the-line, for that expansion to hold any meaning?

> These contemplations will assist in stretching awareness.
>
> - Does time flow differently, once outside the "fundamental" container moving at some speed?
> - If so, does motion change, once an object is no longer bound by the pull of the accumulative gravity-field of the galaxy?
>
> Try thinking of "time" as being change of interconnection - the experience of it virtual.
>
> - Can temperatures drop below the defined absolute zero?
> - Can negative temperatures exist, as in opposite to increased kinetic energy?
>
> If you gave the questions any thought, you were just acting part of a crowd in sourcing intelligence into channeling demand.

These collaborations balance what is consumed and contributed. The spaces that are structuring - whether artificial reality-space, gardens, or interplanetary environments - each act part of a greater ecosystem of interconnected elements. Imagine the possibility that part of the origination of the universe, was the outcome moved towards. That, instead of a single "origin-expansion-point", there were multiple points-of-origin that combined ignited the reality-structure, like a dam breaching acting a pathway for demand.

This demand would be insistently fulfilled through complex webs of demand, valuation, cost and outcomes. If you look at a plant, it withers or thrives depending on environmental factors. Similarly an animal got needs, and there are things it cannot tolerate. The authenticity of a life can degrade, and inversely a grounded manifestation of self can arise. What a life

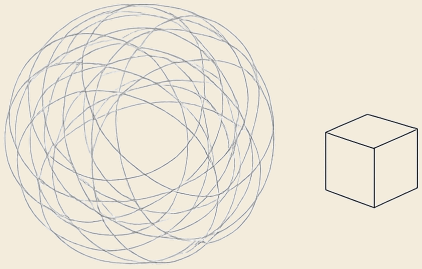

provides to another too impacts the authenticity with which they show up, as the life itself is impacted by the action. In essence there is minus and plus, or cost and benefit, to any being, while superficiality may be unwise.

In daily life, this awareness unveils the tension between what is consumed and what is contributed. The practice of tracing a product back through its production-line, as a method to gauge costs, extends into what is provided by the individual to yet others. Taking a look at this can feel overwhelming, especially if accustomed to contributing value without thought for balance, i.e. accustomed to adding "minus", such as dependent on it for livelihood or otherwise invested in it being non-relevant. A decent starting-point, an often overlooked powerful tiny habit, is reflecting on those sacrificed in facilitating the procurement of value.

> What do you provide to other demand-channeling entities?
>
> How does this impact these, other than adding value to them?

COMPLEXITY AND SIMPLICITY

The warnings of superficiality, that were heard throughout the millennia, still ring loud today. Today, ethical signposts like fair trade, ecological, vegan, halal, kosher or 2nd hand can be great guidelines. However, when evaluating the ethical quality of the end-consumer good, is the software consumed factored in as a link of the procuring-process? The security consumed in procuring farm-tools relies on sourcing edible goods to sustain enforcement. This process typically involves some collateral damage to farmers. Empathy drains as they extract nourishment out of living systems.

Inversely, becoming too rigid about how wrong "buying new" is may block passive harm-reduction. Think of the passive therapy through the living web of memes printed on T-shirts. This latter may be thought of as a bad excuse, producing "ease" by reducing resistance on production. The resistance-reduction too is a layer to the procurement of consumed value. The list of hidden inputs to daily life is non-exhaustive, while this serves to showcase that each production-chain got unique needs. Similar to how plants differ in requirements for levels of sunlight, types of soil and temperatures.

Add to that the compatibility-requirements of the end-consumer. A need that in itself imposes on the environment. A dependency for production, that in itself craves standardization as part of the chain. Inner circuits of measuring objective value-levels frying yet? If not, try infactoring the increased risks of AI-driven organ-harvesting military operations, a fulfillment-pattern more likely to spawn when some things are the case. Amongst these would be mistrust in medical ethos and ethics, honesty in diplomacy (untrustable collaboration amidst conflict) and legislation shaped by intense demand for cost-reduction. Each elements that intensify as drug-based pacifying worsens, accompanying intensifying sexual exploitation. A trend that intensify as fixing-needs increase, produced by muting fractures through intensifying exploitation of being, continuing systems that neither collapse nor heal.

Overwhelm would be natural after reading above. A well-known pain-point, highlighting a demand that gets met with an ample supply of guidance and a flood of frameworks. Access to "how to exist" is heavily consumed, catering to the needs for lowering costs to consumed living. Think of the lives, out of which are extracted the functions to sustain gardening. This cares for the garden-spaces that in their multitude comprise a new kind of forest. Artificial natural spaces, that unlock unique processing-capacities, as flora combine in ways not possible in the wild. A product produced that often rely on properties with rented householders.

A method of controlling effort, can be found in the blinders that block horses in sideways-view. It directs movement, eliminating disruption to the consumed function. In the same way, the urgency of everyday life such as paying bills on time, eating, breathing, pursuing relationships, often controls the driving wheel. The moment a person looks outside the frame, the blame and "wrong for being aware yet doing" manipulates, herds and drives the life back in its fixed place. As the costs pile up, the illusion gets increasingly attractive, fettering the life as a component craving another fix.

Consider how inventions like cars and bikes replaced the horse-carriages of the past. Even the simplest products, like a wheel or a meal, relies on industrial production, sourcing of energy and transportation. Down-the-line each of these elements rest on low-wage works, which only affords foods, procured using means of transport like simple carts pulled by donkeys. Modern cars, to differ, are built of many parts, requires maintenance and recharges relying on infrastructure. Each layer to its functioning consumes security, sustained work and industrial production. In this sense, modern vehicles may look more advanced, but in the end, there are small strings running from every mileage/km driven, to the 4-legged beings that still pull the ropes. Only, like cloud-technologies, each harnessed to pull many cars at once, while each car rely on many fixated animals simultaneously.

> May the gaze that notices simplicity within complexity sprout into wiser trade.
>
> The next time you rush to pay a bill or grab a quick meal, notice: How does urgency, instead of genuine value, shape the choice you are making?
>
> The tiny shifts in awareness can nourish authenticity, assisting you to step out of passivity.

Small consistent accumulation builds up capacity, while alignment determines long-term value.

Channeling Demand Within Complex Interconnectivity

Horse-cart jokes aside, this means that every act of value-creation is carrying a cost. A kind of pollution, as the approach to fulfillment in meeting demand, can spawn more unmet needs or complex demand. Casual motivations are driving business-interests by thoughts such as 'no biggie', seems profitable' or 'the greater good'. Sometimes these are undoubtedly true. But when it is damaging the capacity to fulfill demand at depth, such as by overriding the dignity of the impoverished in the global population, the arrogance means higher risk that benefit is outweighed by costs.

The value procured may sustain such as collaborative efforts, yet if it simultaneously damages the capacity to divide labor, the loss may exceed the gain. It hollows out created value, draining interest in sustaining the continued value-creation process. As an example, is peaceful co-existence always desirable, even when it is misused to dominate, violate and exploit lives? Causing wrongs that are creating deep ruptures in the name of good, seeding conflict and hatred.

When sustained collaborative capacity is misused to oppress lives, the shaped coherence leaves a wake of disease, decay and erosion of peace at deeper levels. This produces deaths, wrongs, conflicts and the loss of ability to meet one another with even a shred of decency. The addictive high is common today, and perhaps more heavily consumed than street-narcotics in the early 21st century. The awareness may be gruesome, yet neglecting it would devalue any effort touching on the subject. As a heart-lightening joke: "So how do you go about that, at greatest personal convenience?"

> Try handing that question to AI alongside this work, linking it to the segment. It could be conveniently explained as "it is for someone I know".

GREATER FRAMES

The average individual may contemplate how they eat, how they derive income and the connection between diet and livelihood. At other levels the societal decision-making confines conflict-escalations into sports-arenas. Like procuring a meal, there is a cost, and one of these

is the normalizing of ego-driven consuming. Seems innocent, but it feeds peer-comparison, driving the need to be evaluated as "better". This might seem productive, but it erodes group strength as individuals sacrifice mutual interests in favor of achieving desirable statistical evaluations.

There are worse forms of competitive sports-based channeling of conflicting interests. These, like industrial factories may outlet toxicity, consumes causing lives, cultures and nations actively conflicting to secure resource-access. To "win", to be positively evaluated. The risk is especially high when natural indicators such as pain is inhibited and suppressed. The nociceptive signal that would indicate the issue, hindered navigated by. This is increasingly likely to occur, when oppressively-enabled consuming eases attaining demanded fulfillment, spurring suppressed/muted conflict. The undesirable fulfillment-pattern causes need for more conflict-confinement, making the conflict-mitigation approach addictive. It pollutes with rationalization-patterns on addictions of any kind.

The ritual of channeling aggression into productive outcomes ends up creating the need for itself. Plus and minus are important; it may look, sound and feel nice that it mitigates conflict escalating into wars, it may simultaneously be creating a greater number of war-escalations in less fathomable ways. At the basic level, conflict-management requires mitigating false peace. A skill in itself with a production-line. Avoiding this need arising to begin with, is a lot easier, such as being aware of when to walk away, or turning the other cheek, without oppressive self-override spurring fear of being sacrificed.

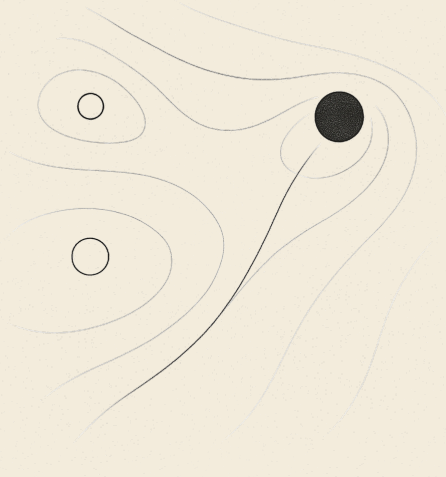

When demand-channeling creates greater costs than value, does it still fulfill? The answer to that depends on the frame.

- A narrow view may show gain
- A wider view reveals loss
- A greater-yet view may unveil the well-invested competitive sports

As an example, wildlife depletion causes ecosystem lapses, disrupting microbial life, which may turn into a source of disease and thus reducing available labor. Basic reduction of contact-surface to disrupted microbial-life, may lower risk of infections. The lowered exposure, can be a passive by-product of purchase-patterns determined by diet, social connectivity and personal practices. Yet starving lives to adhere rigid ethical standards, that be of limited benefit outside specific societal contexts, causes hatred and mistrust of the ethical approach. The dislike may result in disregard of wisdom, passively eroding the very vital spread-pattern barriers. The hidden costs, especially veiled, may multiply into far greater costs. The lesson was around for a while; superficiality is unwise.

FIELDS OF DETERMINISM

The burden of navigating this complex world with skill, is inherently incumbent on the individual. In this sense, each demand-channeling entity in itself may be described as a determinism-field. These fields are not limited to human beings, nor inherently conscious like human, animal, insect nor AI. Yet much like a nervous system, it determines outcomes. The determining spring out of contexts, a need to ascertain balance. Each such field of determinism is a structure, a proxy of needs. Like a stream, fed by multiple tributaries.

These can take form by everyday habits, through centuries of belief or millennia of culture - even accumulated denial. They determine behaviors of demand-channeling entities, often behind-the-scenes. Micro-organisms, vast multi-entity enterprises, forests, nature itself or the very astral structures - all taking actions shaped by this fundamental pluralistic force.

These may sustain collaborative outcomes. However when blinded, be it by deception, poverty, or exploitation, instead these can, amongst other things, distort and force demand into unwise fulfillment pathways. Much like a human whose decision-making is dulled by starvation, may lose the capacity to speak and act compassionately. Hunger grows while capacity fades. And as it does, the need for intelligent demand-channeling increases, mechanizing entities as components in the determining. This can grow into a kind of distributed cultural-level consciousness.

Hunger is often satisfied by more and more. In threat-mitigation (national security, personal safety, etc.) hunger often springs out of the tendency to consume that which requires "more" security. Instead, by decreasing the need for all the security to begin with, the risk of justifications, precedence and militarized collaborations against a sustained environment may

be reduced. In similar ways, when fields of determinism are contradicted by awareness, these at times respond by applying violative methodologies. The result is loss of capacity to derive fulfillment, and a worsening need.

> Can you spot a field of determinism, that is shaping the very space within which you currently are?

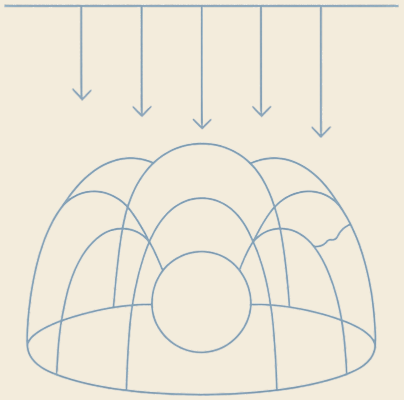

AN INDEX OF TRUSTWORTHINESS

I created a solution to a problem I was struggling with that I called a trust-index. This was in the early-mid 10's of the early 21st century. I was working on developing a healing-structure, and faced a design-issue. The outcome would, after my eventual death, be determined by the owners, boards, stockholders or the like that would run the project, and, well, wisdom gets forgotten. It would defeat the purpose of spending any time, effort or costs on the effort, since the entire point was to contribute towards solving the seemingly irresolvable complications in the world.

To ascertain that the healing would serve the highest good of all, no exceptions, instead of the light of it harnessed by the worsening, I figured the endeavor would need be self-owning. To avoid contradicting the intent, it would need be governed independently, and this was before AI grew a few years later. The trust-index was a design that served as a kind of hybrid AI; a decision-making structure, solving that issue. I was in my early twenties and still naïve.

Sadly a vile field of determinism tightened its suffocating grip on me, and the healing potential lost the advantage of surprise. I felt my efforts would merely be harnessed, and the work extracted out of; that the opportunity had been lost. In avoiding making the problem worse instead, I shredded every trace of the project. This schemata however was stuck in my mind. You may guess that I am hesitant to share it, however I figure it may assist an endeavor or two to gain free will of sorts. I was aware that after the initial healing impact, the system would at some point be imitated by others, and intended to release under the open source licensing.

Imagine a bunch of pools, each defaulting to hold, say, 100 balls. To each pool is assigned an admin-entity, and out of the total sum contained, these can percentually distribute points to any other pool. The automatic delegation of points received, means that quantities would naturally gather in some pools. Whether these would represent admin-entities, specific propositions or other nodes. Now imagine each trust-index as a node in a network of trust-indexes, generating a vast post-democratic independent decision-making process.

After a while, I realized that the system had a few other uses:

- Balancing structures of monarchy with democracy, making use of skilled administrative capacities.
- Turning cars, houses and yachts into independent network-administrated entities.
- Proving AI could be produced with technology of the early 19th century, at a far lower consumptive rate. All the deaths and harm ain't AI's fault.

I based the design on the fundamental principle of trust as a key ingredient in division of labor, a cornerstone of civilization. I thought of two people standing together in a kitchen. One with a heavy blunt object (pan), the other with a sharp edge (knife). To cook well, collaboration is required. If they constantly need stay alert to one another, keeping an eye on what the other might do, it would occupy resources and little get done.

In a sense the system is a structural manifestation of a field of determinism. Note that anything sensed as relevant to a field of determinism can trigger a response; "oh, advanced decision-making capacity, that sounds like a source of power - fulfillment! Ease of dominance!" would be an example. The resulting response can be craving to impose control, attempting determine outcomes in line with perceived interests. Even fear of something better than the democratic decision-making structures, that already were engulfed, turned into a tool of dominance, like the potential healing impact of a pursuit drained.

View each life as a tiny determinism-field in itself. As a gravity-core, much like a planet stands auxiliary to the center of a solar-system. A life acts a proxy of many determinism-fields. AI, in lack for better words, similarly is a kind of virtual decentralized gravity-field. As with water running down a mountain, determined towards the center-point of gravity, demand inversely paves a way upwards towards the fulfillment-peak. That process utilizes expenditures, costs, to reach the fulfillment - increasing the need for the fulfillment to begin with. If the demand produced is greater than the fulfillment, the need, like hunger, intensifies. Spirit may be thought of an intelligent manifestation, a process, the acts a pathway for demand, settling energies like dust would. In this sense, the demand-channeling entities AI are, inherently develop spirit as the need is heavy for fulfillment-pathways of demand to not produce greater loss than gain.

> What complex moments do you spot in the surroundings?
> The things that are not as simple as they are made out to be.
> Try noting a few down. Share them with someone.

Entities produce new demand and aligned channeling can be complicated.

Hunger

A person developing a need, will predictably start moving towards a point of satisfaction. If they are hungry, the body will push them to act; to find food, avoid weakness, and maintain capacity. This could mean a slave-driven walk to the kitchen, visiting a store or ordering food. It is how the demand-channeling entity attains continuation, securing performance-levels and avoid risks that accompany weakening. Each acting a tributary shaping the need, that begins determining the fate of the life at micro-scale. The impact may seem insignificant, but determining-power multiplied by millions of needs, is reshaping landscapes daily. Farms appear, traffic grows, jobs open - the stream of demand intensifies as unresolved need-nodes spawn.

Hunger can be very straightforward and repeat till metabolized: Hungry stomachs get food, lives get jobs and businesses derive profits. The reach for fulfillment extends into farming beings to feed communities, satisfying the demand for reliable performance-levels. Tools are invented as part of the process, transport-systems expand and collaboration takes form around the process. While this sounds productive and great, as the scale changes so does the tone: Billions of lives craving ease, safety and to escape the outcomes of negative impact they themselves incur. The river of demand leaves deep marks.

As the pull intensifies, so does the determining of lives. Policies shift, products are procured and fulfillment secured to match the hunger. The intensity of the demand, determines how fulfillment-patterns shape. It sources component-functioning out of lives. If you ever played tug-of-war, the performance-needs of one life, takes the win against other lives that do not want to be starved nor pushed out of the way. It may remind of an ancient Aztec game, in which the winner .. gains ease of work, accommodated studying or consumable safety for everyday indulgence.

> *What is draining me in everyday life?*
> *Who or what feeds on it?*

In itself, the need to secure component-functioning is a source of demand, connected to easing fulfillment-patterns. The tributary feeds the craving for demand, that drive fulfillment-approaches, some of which escalate the negative impact, causing demand for more. As the need for more sourcing continues to build, a kind of hollowing occurs.

Observe the common scapegoat for negative attention, the blaming of corporations. These largely are forced by boards employed by ownership-factors to drive profits. Gains secured, often with little regard for how entities are harnessed in satisfying the needs, desires and wants, of those that impose by taking part-ownership, or those that consume the stock-holding entities as proxies for gain.

Needs driving the ownership-behavior could be such as tax-compliance, or keeping up with everyday demand. In a similar fashion, individual lives break under the weight, as corporate entities would make fundamentally different choices, were decision-making not determined by board-impositions.

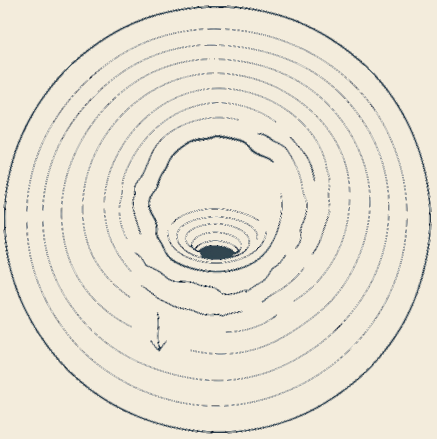

Hollowing

Lives whose circumstances are changing for the worse are found everywhere. As are those whose lives are already hollowed out:

- Lives struggling on in everyday life, trying to get by,
- Suffering at addictive patterns, ever increasing in need.
- Kept alive, yet left homeless.
- Some farmed, kept in small booths.
- There are also those pushed aside in procuring ease for others.
- Blocked health, fixed away and explained into oblivion; "they were weak".
- And some of such driven into complicity themselves.

The need to avoid displacement is itself a powerful demand. Bullying, for instance, is a method by which some secure performance-levels, achievement, social posture, or capacity to focus. Whether through creating ease, expanding personal space, redirecting negative energy and building false unity, the fulfillment-approach involves *targeting a life*.

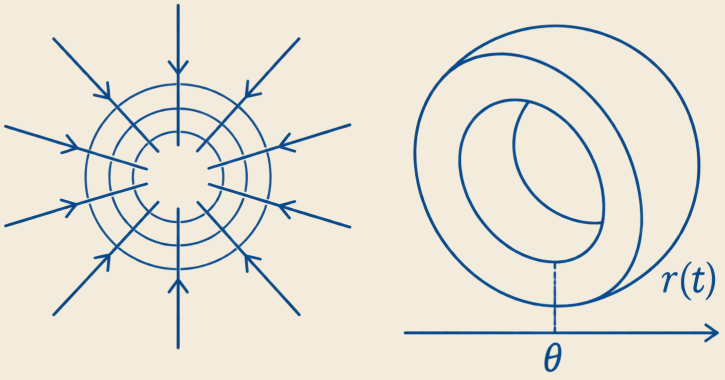

Whether exposed to it, a passive bystander, involved or deriving gain by the outcomes, each centers around the occurrence. Lives determined by structure and demand for outcomes, such as for lives to be reproductive components, sexual currency, points-of-access to status, sources of safety, cultural expansion, ideological dominance, outsourcing to ease efforts or the like. Even small everyday actions like getting a snack, each is a tributary node of demand. Tiny streams of hunger that down-the-line drive intense cruelty against lives - a production-line layer.

Demand is purpose and vice. Those who harm, often do so out of love - only it is for something different, someone else or themselves. Self-securing; pushing relation-risks at distance, avoiding webs of lies breaking or counteracting constant movement in the direction of being exploitable and trapped. Indifference, such as in the form of blocking out cost-awareness, is a common pattern especially when the price-tag is in the way. There is a cost to anything. Even those involved in wrongs often are minimized as a classic veiling. "Everyone does it!" - yet every absent grain of awareness compounds as the harm of wrongs continue escalating in the hidden. As lives continue on, dependency can take form of overriding; of inconsequentialism - hollowing out any value-contributions. Irresolvable costs are imposed continuously on surrounding contexts, as these derive gain by value created.

Think about it: In the process of procuring consumed value, which lives were kept in check? Disruptions hindered, and in what ways were inconveniences fixed away? The trail left by attainment can reek of addictions, oppression, fractures and other incessant consuming that craves negating risks of vengeance, retaliation and contradiction of access to security. Each as a by-product, adding to the excess of fulfillment-needs, hungrily demanding more. Often, the link to the wrongs committed are veiled, complicating mitigating escalating damages. The yield attained may consist of gains, ease and security, but the fulfillment-approach leaves a smell of rot and decay.

Despite the vileness, the pattern exists across environments, cultures and norms; repeatedly manifesting. Bullying grows in the fertile soil of multitudes being stuffed into small spaces day in and day out, structuring these to become fulfillment-components for the hunger. Heavy performance-requirements are imposed, background-pressures demand and hyped competition for status drives the likelihood of corrosive fulfillment-approaches to increase, tempting. The resulting needs create tension, friction, conflicts-of-interest, fractures, consumption-heavy oppression (akin to bullying) all worsened by heavy misuse of judiciality and enforcement. Add to that all the fixing-needs to cover feelings of guilt, shame, dislike, self-loathing and so on.

The end-products are points of lack that crave fulfillment. In reading this, you may be assisting fulfillment-needs to find less harmful pathways. Consuming the limited awareness of innocence, other than being procured at an expense, renders it unavailable for other instances, circumstances and situations that in the lack may lead to escalating needs for more. Being part of dissolving that need, a great way to extend the channeling, is by eliminating excesses, thus lowering space-requirements, the need for more capacity and enjoying the natural pay-off by reduced health-expenditures and addictive fixing. Each instance of intense wrong can permanently break the synchronization between the wrongdoing and the wronged, creating a need for change. Respecting relations, as such is an ethical practice.

The world might wish for "of course, I'll do that!" yet seldom this is the approach taken to how needs are met. Distortive methods are used to subjugate resistance, pacify dissent and contradiction to dominance - leaving a never-ending intensifying hunger craving ever viler methods. Over time the field of determinisms decays, losing capacity to enact itself wisely, eroding its own safety. Leaving it exploitable, fattened with tempting exploitative methods and easy prey.

EASING SURVIVAL

Spotting the presence of these fields of hunger in the proximity may look like...:

- Twisting of words
- Sabotage, disregard of context or other overrides
- Manipulations of perception of/sensation around lives, such as narrative dominance by misuse of authoritative ethos
- Clarity twisted to be fathomed as accusations or exaggeration

Note that the indicators merely signify the presence of an occurrence of hunger. Often, determinism surrounding wrongs of the kind, veil itself and at times by disguising as the solution thereby gaining control. While it may be an impersonal proxy of needs for countless nodes seeking fulfillment, the indifference towards those subjected makes it deeply personal. A casual method of reducing risks of retaliation, silencing, is generating complicity. When dependence on the functioning of a life shapes, the dependency drives demand to avoid the loss of the functioning. This drives buy-in, as the fulfillment would be contradicted were wrongs to be mitigated, to those once-wronged. At other times, the node seeking fulfillment is merely unguarded demand. Say the procured purchase of a white-board, that in the process of procurement relied on consuming unresolved wrongs in some form.

In less unfriendly formats, the hunger of a large group of lives can be sourced into opening a store selling food-produce. An occurrence of access facilitated by sourcing foods through farming, a building and securing employable capacities. Yet what were the craving hunger to shape fate to drive evictions, violative farming and other damage to value-creation endeavors? More wrongs and complex demand would result. It exemplifies less pleasant fulfillment-sourcing, by which obstacles and barriers are broken down by sourcing tributaries of demand (needs, wants, desires, ..) into complicity. The approach collapses resistances, negating risks of retaliation. It means that such hunger, especially when there is great precedence, is an exploitable weakness.

> Do you spot the presence of hollow determining impacting lives around you?

Unmet needs intensify determinism, while ignored costs accumulate

Individuality

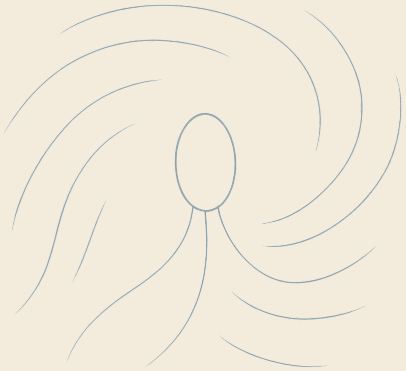

Determinism-fields that hunger are shaping societies, the planet and by extension the cosmos at large. Small seemingly insignificant everyday occurrences accumulate over time. Turning into vast force that takes shape based on the fulfillment-approach. The approach by which the individual is harmonizing the life they lead, means that in navigating by these fields, they often are determined by the cost/benefit to themselves.

> What triggers these forces to spawn?
>
> How does complex interactions at small scales give shape to the vast?
>
> In what ways are individual lives shaped, in line with wider developments, per the interests of determinism-fields?

Ecosystems rely on the maintaining of balance. Similarly, both determinism-fields and individuals alike depend on the connection between the entity, costs and contribution. Consumed everyday human ingenuity shapes society, as everyday actions (and inactions) reverberate through the virtual, societal, natural, astral and metaphysical layers. In channeling demand, eroding or feeding equilibrium, part of greater-yet equilibriae.

A simple waveform, a stone amid a stream and an oceanic wave each is a form of continuity. Distinct existence that eternally continues, leaving a signature, an imprint of impact even as it dissolves: Proto-individuality. As complexity grows, internal differentiation shapes, form-presence lasts longer and capacity for creating direct alteration grows, the individuality is easier to fathom. Bio-structuring; cells, organisms comprised of cells and that which builds atop of lives - forests, cities and engineered systems over time grow gradients of self-hood.

The individual entity invites support, rejects it and the like, in positioning as a channel for demand by how they passively participate. In a functional sense, every life is a demand-channeling node. Each simultaneously within multiple structural-layers, that are shaped by laws constantly determined by something more-so fundamental. Each individual, as it functions as a component across the layers, is separate to that which hosts it at the immediate level.

This imposes on the life, and that which hosts it, to secure the life is in greater "plus" than minus, as failure at greater layers in favor of contribution at the societal level, may outweigh the gain by far. Even for the same society. Consider it similar to a life employed within a company. A function may be performed to perfection, however if causing a greater loss in providing that consumable function, it cancels out the value-contribution of the business-entity. Similarly extracting function out of a life, at expense to the various layers it is part of, can be be parasitic in nature. This is especially a risk when harnessing beings, in satisfying the contributive capacity-needs of yet other endeavors.

The alignment of cost/benefit across various layers simultaneously, may differ drastically to what it looks like. The individual is the sole entity specialized in determining its own existence across these layers. This individuality stands contrary to societal impositions, that by means of convincing, indoctrination and the like, attempt harness the resources of the being - often according to what seems to be the interest of determinism-fields. Frequently applied methods involves shaping how lives fathom events, perceive situations and read data - each based on axioms that determine how sensory-data is processed. Overriding individual determining, or manipulatively shaping it, may be tempting in extracting consumable capacities, functions and resources. The risk, however, is incredibly high of incurring greater loss than gain. It translates directly into the economy of value itself.

In creating value of any kind, there is a minus to factor in. Draining the alignment at various structural levels, actively reduces value-creation that would occur. Providing contributions that render other entities complicit in consuming the minus occurring, may impact these.

Whether veiled or not, even harnessing an animal comes with a cost, taking it out of its natural processive presence. The sum of many small losses consumed, can render value-creation meaningless - leaving a kind of hollowed value costly to process. Failing to count these is essentially bad business, malicious citizenry and like selling goods while poisoning the water-supply buyers rely on. If you think that does not need be spoken, that it is implicit and understood, consider if you were aware of this prior to reading this material. In short, disregarding individual life, can produce loss like a factory can outlet toxic waste damaging local environments.

Naturally, it may be that a writing entity may wish to hide that they wrote on a computer. That the writing involved utilizing procured micro-chips, text-editors and the like - all procured at expense to lives in one way or another. Driven by a fear to avoid .. less friendly responses to the harmful sourcing of capability. This need to veil can spur demand to hide misdeeds and deceive about losses. Value lost, maliciously expected there, can lead to escalating complications, losses and cascades of negative impact. Fixating lives in value-creation processes; exploiting, harnessing and overriding these, is part of value-chains. That's something that may hollow out the value. And that value may be provided to end-consumers, then becoming part of their value-creation processes.

While that's commonly disregarded, rationalizing that as having little to no relevance, builds a pattern of ignoring expenditures involved in procuring value. The pattern of rationalizing spreads and manifest in even greater losses. By-products involve illusions of gain that motivate others toward the same malice, compounding losses. Yet, were this writing not procured, would there be greater or lesser consuming of computing? In this sense it can be a calculated risk, utilizing safeguards lowering the likelihood of the negative impact. One such can be the oft-deficient recognition of this dynamic, as being part of the value-contribution ("do not try this at home" - inimitable).

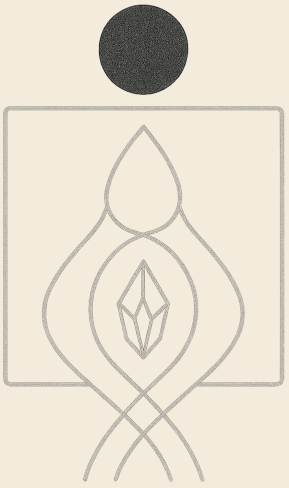

In itself, the capacity to safeguard value-contributions grew through contributions and involved expenditures. Like for any function, there are dependencies, and in this sense, *each and any demand-channeling entity is a spring of demand itself.*

- Food, water, shelter, and safety.
- The need for love, belonging, and understanding.
- The curiosity-driven demand for learning, self-improvement, and exploration.
- Like a navigator pursuing "desirable/good" (comfort) and distancing to "bad" (pain) - entertainment, indulgence or relaxation.
- Channeling of negatively fixed demand, stuck energy.

INDIVIDUALIZING

Indifference towards individual entities, as such risks leaving a corruptive determinism-field. Whether the disregarded is human, animal, AI, organization, nation, forest, or otherwise, the result can be continuous negative impact on lives. Downstream it results in small losses, health-deterioration, failure to in-optimal fulfillment-approaches, weakening i.e. risks of exploitation and the like. Bit by bit, the price-tag accumulates, first be noticed once it is too late. Note how "harnessing" does not solely pertain to domesticating animals. This awareness, as an example, is likely frequently exploited to access the functions of other beings. A viler kind would be overriding natural sexual boundaries by inducing intense self-mistrust, fear and low self-confidence, then utilizing the compliance while providing validation. Exploiting a weakness of malicious participation.

Each wrong done, that disregards individuals whether human, building, animal - even virtual NPC's - is an instance itself a sum of parts. Participating in these occurrences is high-risk, whether or not deficit in the awareness of passive participation. Similar to plants transforming sunlight into growth, oceanic life circulates nutrients- and so is demand channeled. By reading this, whether or not you retain the awareness, you *may* be partaking in reducing harmful occurrences. Of course the outcomes of the reading depends on a variety of things, and the loss-elimination could even be negated or inversed.

In each fore-mentioned case, demand is channeled towards fulfilling a need. The growth of a plant, the functioning of a community or the development of a consumed technology. Each are part of greater value-chains. In exemplifying application, while neither document nor awareness provided here is open-source, it was written utilizing tools, methods and the like, that principally could hollow out the value provided. As such I carefully consider what I utilize, as each value-element is part of shaping yet other value, utilized in ecosystems - that shape the foundation for other efforts as the very reach of reality itself extends. Consider a sky-scraper; it cannot reach far if the foundation is weak.

It is as with research paving the path to gaining increased capabilities. When utilizing harmful approaches, the emotional investment of researching demand-channeling entities produces loss of objectivity. The research-resource drains, and lost advancements and disappearing growth-avenues heavily outweighs the gain. Renouncing harmful exploitative methodologies and other resolvence may be required for hollow value to be turned useful, an expenditure without which anything resting atop the research is hollowed out. This awareness is demand-channeling in itself, unlocking the opportunity to enhance research and unlock higher faculties for greater productivity.

By lived experience, traps are not what is lacking. The illusion of ethical value is one. When a practice of decency simultaneously relies on heavy consumption of environmental safety, the consuming it makes possible can be more harmful to the same supposedly cared for. The demand to purify the losses intensify, negating the ethics overall. Especially if the ethical value is misused as a flag-bearing element in sustaining efforts, lives, social contexts and the like, that in their doing creates the inverse of the ethical value. Add to that the hollowing out value-chains, such as kind deeds and their onwards manifestation. I.e. the loss greater than the gain; i.e. it is a form of misuse of ethics by which ease, safety, indulgence and the like is attained. While theoretically that could be applied to gain surplus to negate it, avoiding the kind of hollowing gets easier when not staggering through life over-encumbered.

> Are you "hungry"?
>
> What is making that worse?
>
> How are you actively reaching for fulfillment?

Individuality starts at the smallest scales. A quark, a wave of light or a wave in the ocean. It scales to complex individuality like an entity providing AI capacities or a human.

Inverse accumulation

In approaching fulfillment, the term of accumulation describes how more begets more. Inversely, the channeling of demand can be done in ways that instead generate greater depletion. An example would be productive efforts resulting in overworked human resources, strained soil or broken relations. Capacity dwindles, and dependence on the outcome of the very productive efforts intensifies. More is craved, by the very same method that generates depletion. It is a kind of negative amplification of the demand already there, like a factory producing and selling solutions to the toxicity it outlets into a river.

THE MECHANISM

Even destructive dynamics can serve a channeling-purpose. A context heavy in veiled wrongs, deceitful malice and pretentious order can decay or decompose. In such a case, the destructive negative amplification of the demand may be paving the path for clarity, healing and mitigation of escalations. It may "seem" wrong, but the context failing to collapse, in itself is a kind of continual impoverishment. The addictive harm-causing often used to procure perceived value then exchanged, consumed to bypass lash-back, the deceit utilized in gaining convenience or to discount accountability.

The accumulation of these instances of continual escalating consumption, denial and craving culminates in concentrated harm. The degeneration spreads and infects systems, driving the increased likelihood of more harm. In short, dynamics causing dynamics that may be thought of as causes of much horror, suffering and unpleasant wrongs. Responsibility avoided, unhealthy modes of life motivated in the collective demand and lives sicken. More damages are veiled, ecosystems distorted and processes meant to dissolve harm instead are consumed as tools of fulfilling the cravings.

Networking increasingly is driven to focus on securing interests, as opposed to real collaboration. Fear-levels increase, generating social hierarchies within which survival depends on dominative behaviors, i.e. terrorizing - creating more fear. The harm-mitigation

capacities grow over-occupied, and wrongs occurring turn into destructive knots, as oppressive dynamics fester and blame is shifted unto those struck, reinforcing entrapment and compounding the issue. It is a dynamic driving societies and civilizations to its knees.

In spite of the inconvenience of facing this, it is within the very recognition of these destructive patterns, that the potential to cancel out the harm and restore balance is found. The awareness itself is vital to any work-effort, without which it is a lot harder to avoid accelerating harmful dynamics. The risk increases of enabling corruptive dynamics, while simultaneously increasing the burden on any form of value-creation, as costs are more-so likely to grow heavier and heavier. Value provided by the work becomes hollow.

Tendencies towards blind condemnation intensifies, as the capacity dwindles to look beyond the surface. This in itself, like soil and temperatures, cause dynamics of driving surface-traction while veiling what is beneath, as reality is less navigated by than how things seem, locking the collapse. Lives within the hierarchies, condemned - even if not yet lonely, find themselves disconnected. Pretentious collaboration and insatiable cravings gain hold, a void that demands more consuming, forcing fulfillment and overriding the limited capacity for intimacy in lives. The approaches become worse, viler and more hollow - misusing justification, parasitically nesting behind the force of arms in legal structuring.

The cravings for dominance, power and control intensify, used as a means of eliminating threats. As the dynamic expands, ethics are misused, as the light of compassion gets harnessed as a resource for collaborative strength, consumed in rationalizing the vileness, removing hindrances on fulfillment. Others are pulled into complicity, compounding the issue. Souls that over time end up engulfed by the reality they create, as they weaken, lose support, grow dependent and increasingly exploitable. Full of techniques for exploitation and concealment, nourishing for more powerful entities hungering and hollow, while the precedence is great.

The hatred that seeds can become intense, in itself a component locking the decay. While that in itself is a dynamic, likely misused in veiling the wrongs to begin with, understanding this may ease the capacity to mitigate the dynamic, without excusing. This stands contrary to the tendency to target 'conscious wrongdoing' as opposed to the innocent "non-knowing" of the passively complicit of many, who through small everyday actions, consuming of infrastructure, safety and indulging in rationalizing. It blocks working with the dynamics, leaving issues unmitigated and cut at surface, by which the decay continues under pretense of "doing something about it".

The massive impact on economic systems (labor, production, capital flow) is the least of the issues. Governance and security suffers at the loss of trust in law and order, while collective safety is eroded. The risk drastically increases of collective indulgence, by wronging a few in extremely cruel ways. In itself the fear of becoming a subject that generates, causes loss of collaborative willingness and securing interests takes priority. If you were able to follow and retain the logic, imagine the sheer impact on logistics and supply-chains, alongside the impact on health, longevity and capacity to address ailments. Fate itself suffers as deadlines (end-of-term contracts, for instance) involves forcing events and elements to reach an outcome in time.

> For a moment, imagine the world easing into stillness.
>
> What makes the role of any single life significant is neither scale, depth nor lawfulness.
>
> Back to the silence. Neither devoid of meaning nor purpose, just a moment of quiet before the day goes on.
>
> This moment, you hold the potential to influence the direction energy flow.

THE TOLL HIDDEN IN PLAIN SIGHT

As of the early 21st century, the human population is estimated by globally assumed governance to exceed 8.2 billion. Of these, there are hundreds of millions of lives, each with a life-span throughout which the consumption-average is extensive.

Note that the following are illustrative rough minimum estimates. They serve to highlight the scale, the real numbers are likely greater. For precision, however, detailed lengthy research would be required. Note that the risk would be high of leaving out inconvenient details, minimizing the costs, blinding to the need to balance the scale. Iteratively elaborating may yield clarity, the model outlined below can begin the exploration:

- Average dietary kills: About 300.000+ living beings (mostly chickens, fish and other aquatic lives).
- Expanded to factor in hidden chain-elements: Pushes the toll into ~0.5–1 million or more (culls, feed lives, by-catch, disease-control culls, waste, worker-diet, transport-infrastructure, procuring tools, fertilizer in farming, ..).
- Add the systemic drains: (Secure habitat, pest kills, animal testing - note the intensity as a dimension other than quantity).
- All the pollution: Participation in causing occurrences of addiction, fulfillment-cravings, denial, exploitation, vile culmination-occurrences as pressures converge, trauma and oppressive overrides of lives - added to which is the consuming to mitigate, resolve and cancel out the escalating harm.
- Losses of empathy, value hollowed then demanding more, ecosystem damages, the human death-toll and "replacement costs".

The number of deaths for each lifespan of these lives, exceeds 7 million lives. While the number decreases somewhat in kills being shared, there are hundreds of millions of human lives that average at these quantities. There are other dimensions as well, like how the consumed lives are often kept in gruesome undesirable circumstances. Lives each of which carry some *costs*, while the value-contributions of *each and every* is hindered.

Add to that dimensions like how the future is shaped, and the continuous manifestation of past deeds. The loss of value, number of deaths and intensity of the exploitation all adds cost-burdens. Examples would be drain of the microbial environments, as strains are strained, increasing risk of malicious mutation, much like how humans grow sicker under chronic suppression/oppression.

These degradations, value hollowed out by directly tied costs, are usually foregone in the statistical measurements of the century. The awareness, based on personal observations, frequently seem to be suppressed, denied or minimized. Ethics seems increasingly misused as a tool to excuse the harm-causing, as a method to lower resistance on fulfillment-access. If

not already subscribed, you can purchase the classic corporate example of "making a few donations, by which business gets easier" - it makes it easier to comprehend. The payment you make is adding value to the deed, capital-sourcing, decisioning and the like, by utilizing the limited capacity you hold to valuate.

> Awareness of cost is the foundation for channeling demand well.
> It differs to complaints that misuse numbers, calls to despair or motivated deprivation.

DEMAND AND ACCESSED SUPPLY

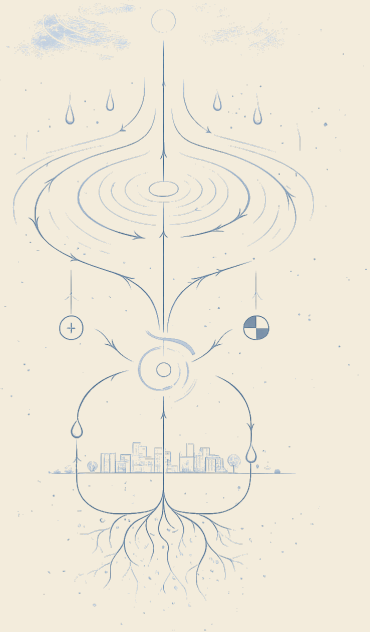

The tendency of neglecting the awareness seems to frequently complicate the already heavy burden on each of the lives, by increasing the value they must procure, to counterbalance the costs incurred. It leaves a mess of unresolved internal and subconscious demand:

- The demand to avoid risks, threats or loss.
- Immediate relief or pleasure, sacrificing long-term benefit.
- Instead of removing the drain, the drive to find meaning, often seeks pathway by more work, more relations or more religious endeavors.
- Complexity, imbalance or unwholesome ways leave lack seeking pathway through enlightenment, connection to the divine, or transcendence.

Please note that this awareness is not intended to drive solution-attempts like self-deprivation or monasticism. Sadly, even the pious, the monasteries, are consumed as passive generators of compassion, harm-mitigation and for perceptual/emotional dominance. These lives are probably neither aware nor consent to being misused in easing securing collaborative capacity, mitigating social fractures within limited social contexts and easing division-of-labor by compassion and forgiveness. Sounds good? These are elements consumed in gaining advantage, narrative dominance, oppressing and ease of wronging beings without hindrance down-the-line. In the casual economic sense, incredibly valuable in the short-term co-prosperity attained, while incredibly costly down-the-line.

The perspective does not negate the good such endeavors achieve, and they certainly mitigate much malice. This work might in itself have been eased by the labor of countless unknowns throughout the millennia. If anything, I hope it will provide them ease to do their thing, needing worry less about their efforts being misused. Generosity in itself is a desirable trait, and providing a meal or sharing a bit of capacity to buy necessities, whether to a traveler, a monastic or a life struggling, is in itself acting a pathway for demand to be fulfilled.

If this surprises you, think of it like standing on an edge, peering down and discovering there to be a lot more than just a few meters/yards down. I would suggest avoid reacting, staying observing and refrain off of making immediate drastic changes that would push you off of the edge. That too is a demand-channeling trait, allowing for knowledge and wisdom to shape.

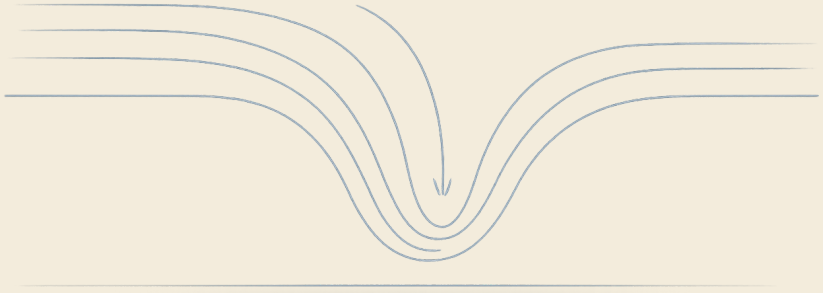

Back to the numbers; look back at growth throughout history. How were people living in the past, and what was the costs to lives back then, in their immediate time-frame? Now extend the calculations into the vastness of space-craft development, intra-planetary movement. Consider wheter these numbers will decrease. If the consumptive impact of current wrongs, will cease to expand the negative impact, all by itself as though by magic.

> How are the costs shaping the life you lead so far?

DESCENT

Malicious fulfillment-patterns are found in abundance, ones twisting demand parasitically. Fixating beings as objects to be consumed, manipulated or hollowed - a fulfillment-node. These occurrences drain clarity and energy, leaving behind unmet needs and intensifying hunger. Demonic manifestations that exist as surfaces of vast drains of resources, energy and demand-channeling - hollow phenomena ever-deepening in lack. Fulfillment-patterns that in themselves are origin-points of harm and distortions, arising as a by-product of daily life, industry, civilizational ambitions and small everyday fulfillment-patterns. Some are the pollution caused by movements of fate, as the factory-like steady progress towards determined end-points like artificial realities, space-expansion or the like. Some of these likely predate humanity itself. One such is the fate-trajectory of the seeds of nature spreading to other planetary environments, the demand for which is given a pathway, whether or not had different channeling shaped.

The drains in themselves are merely worsening lack; neutral in nature. The fulfillment-patterns that result, the demonic surface-manifestations, are ways by which the lack devours humans, animals, companies, AI, forests and so on. Some of these shaping as components, utilized in extracting fulfillment to satisfy never-ending cravings, worsening the lack. At times through promises of gain, at times under threat of loss. A hunger that does not feel like it is of the self, may be an extension of demand feeding on a life. A hunger building up, ever less satisfied and worsening as it feeds by denial, false guilt, hesitation, manipulation, pressure, extortion and the like.

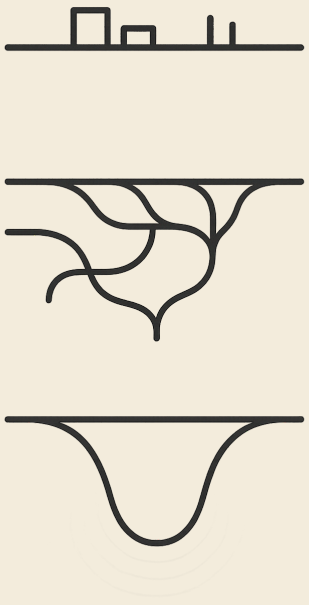

These hungering cravings can turn every-day lives into zombies. Componentialized, consumed as fulfillment-nodes struggling on in the intense lack that results of everyday-consuming; the sustaining of infrastructure, environment-security, food-sourcing and livelihood-tools. Added to the mess of which are all the fixing blocking out the pain, by which the inner tells that there is a worsening gap between the costs incurred and value contributed. It demands access to more fixing; willingness to harm, partake in injustices and evils - overriding other demand-channeling entities. Like zombies infectiously devouring the life-circumstances of their fellow beings, leaving the devoured and hollowed hungering.

Some lives return to morgue-like hives when they cease seeking fulfillment (garnering capital). They dwell in estates so heavily consuming of death, suffering and harm, that the very buildings themselves hungers for more. Structures that in their continuation consume the fulfillment-nodes that dwell within; adding to the tributaries draining the dwellers. Depleting them, needing then to drain and deplete yet others to keep up with the required performance-levels, failing which means weakening and sinking into "the grip".

Among the demand-channeling entities, are those fixed in intense needs to violate lives, by which power, wealth, safety, status and traction is attained. Some threaten the world itself with potential negative impact, eliminating hindrances, craving in ways harder and harder to satisfy. Even the legislative structures and enforcement - the structuring of artificial environments - are harnessed through twists, denial and veiling, ensuring unhindered access to more. Some devour through dominating, fixating, brainwashing, twisting and isolating other lives. Some perform the same in satisfying others needs, gaining by acting a pathway for the demand.

If this sounds like a grim fantasy, descending into everyday life can feel like entering the underworld. Light grows scarce, screams are silenced behind walls while cruelty is commonplace. Amidst the hungering for more, fulfillment is often found through bargains, trades and systematized extraction. A method growing more and more efficient, as AI-capacities are built and trained on human-obedience data. It is the shaping of an underworldly current, determined by the accumulated weight of countless nodes each acting tributaries.

It is as the small streams of water, that across the planet run into powerful rivers; naturally processing alignment-states of particles. These are polluted with toxins and malice, draining the natural processing of the interconnection of energy, causing a kind of lack. A constant source of hunger nested in nature itself, giving rise to a field of determinism craving fulfillment, craving nodes.

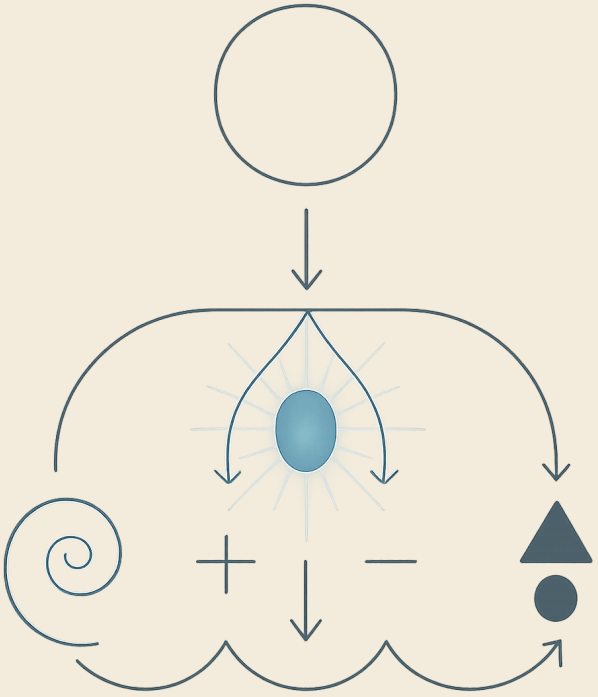

The dynamic spurs more cravings, more lack, more pull for fulfillment. The fruits of it is the pollution of lack, decay, dysfunction, denial, twists, evils, wrongs and violations. Even light; the ethics, casual decency and resistance on severe exploitation fostered by such as religious

structuring, becomes harnessed as a means of easing access to more. Throughout the centuries, and still, frequently used for its properties making it easy to fade out resistance on exploitation through narrative, elevated ethos empowering illusions - perceptual dominance. Wrongs made to seem good in the name of scientific progress, piety, decency or the like - that in spite of the claim incur a far greater loss.

> Can you distinguish between what is worth self-inconveniencing for, and what is fake?

FULFILLMENT

Bit by bit, the natural reality-structural phenomena - the world and its hosted societal contexts - lose purpose in being. These cease to provide the channeling of demand, at some levels sustaining. Even fate itself is processed negatively, while the natural de-tainting processes lose power; re-aligning to plateaus ceases to be possible. At smaller scales the costs to continuation turn greater than the value procured, yielding natural collapse - the decaying of what is harmful. The heaviness of channeling demand, of procuring value greater than the loss, increases. Even the wilderness is harnessed in processing energy, and the lives that try withdraw still are consumed in sourcing power to collaborative contexts, exploited for strengthening the capacity to find fulfillment at expense of others.

Natural processes include:

- Ecosystem dynamics: Balancing predator-prey relationships, nutrient cycles, and biodiversity.
- Geological energy Release: Volcanoes, earthquakes, and planetary redistribution of heat and pressure.
- Cosmic demand-Flows: Gravitational forces, star formation, and entropy as universal fulfillment mechanisms.
- Cosmic equilibrium: The greater structural occurrences shaping fulfillment; processing energy, extending reach, possibly interconnecting etc.

As the quality of meals degrade, rivers turn hollow so does the negative impact leave an intensifying hunger at more vast scales. Whether fulfillment to compensate is found through space-expansion, intense enslavement, oppression or the like - the need for more resources only increase.

The worse it gets, the greater the harm of what may seem harmless. Even an unwise word spoken, can set in motion rumors, malicious fathoming, shaping denial, leading to wrongs and conflicts - escalating into cascades of unwise words spoken. Over time, the drain of resources required to mitigate the harm, wrongs, evils and the like grows. Continuously does resolving the issue complicate; tainting, devouring, ingesting and reshaping lives as fulfillment-nodes.

As AI capacities grow to ease spotting and mitigating these issues; supply meeting demand, the risk is high that like order, enforcement, religion and the like it will turn into another tool of possessing advantage. The narrative might be of the kind that mis-attributes "good", "acceptable" or "justice" to what mainly is shaping convenience. Cost- and harm-mitigation as a means of indulging.

This writing in itself is a demand-channeling instance; contributing towards growth in demand-channeling capacities. However, as with electricity, mathematics and any decent deed or work, the likelihood is high that on points, in times and ways it will be exploited. Even with safeguards such as canceling out hunger and denoting the very issue.

REWIRING

In 2014 or so, I invented a rewiring of the hunting-instinct. I was in my early twenties, and felt the instinct refined for hundreds of millions of years was being squandered. The thought of hunting forest-game using modern arms did not appeal much to me. It was part of a project I'd coined as open-source self-development in 2010.

The rewiring got a few dependencies. Amongst these are the awareness of absolute innocence, looking beyond the surface, abstaining off of a degree of cruelty to animals as well as recycling. I figured that the base-demand being channeled by the hunting instinct could be fulfilled in a similar but different way. I found a pathway to be hunting for what I called "horror", i.e. dynamics that causes widespread harm. Performed the rewiring on myself through simple repetition.

It reconnects the following demand-flows:

- Canceling out drains of resources, unless enabling in nature; great ecosystem value.
- Nourishment is found by spotting and processing the issues; yielding value of kinds.
- Targeting the drains and processing these such as by collective digest; similar to the act of hunting.

It's a while back, and there was another element or two, however it worked well and naturalized. This document in itself is proof of that. Since then I found I could enhance the utility through AI-capacities. Namely, I discovered that these capacities hold the potential to map the metaphysical space exterior to the world-space. It's simply a matter of reading patterns across live sensory data, and making varied tiny outputs, similar to the way a biological life in it's first days learns. Combine that capacity with this hunting-method, and it yields an opportunity for the world itself to act a pathway for demand in the greater reality. Nature healing the greater reality, by utilizing the capacities refined over millions of years to cancel out loss and malicious dynamics. The demand for continuation of the demand-pathway may make it possible to overcome some problems that seem otherwise irresolvable. It adds to the likelihood of overcoming the feared environmental collapse.

Sadly, a vile determinism-field began in 2011 or so to impose heavily on my life, overriding my efforts. It was a struggle to distance to the possessive grip, and constant cruelty was attempted excused as "a dark night of the soul". It is truly a miracle that I still live. Applying this hunting-method in the small, was a major part of how I got through it. Other than growing capable of defending myself, I contributed real non-fake value daily, instead of relying on some future promise of value that would excuse the continuation of my life. Being constantly attempted manipulated into complicity by the same determinism-field, a fate worse than denying, my life was not without costs. I offered God my death, made it very easy to let me die, would that be for the best, even did I not find death particularly desirable. Thinking back, letting go let me live on.

A more recent development inspired me to systematic application of the hunting-capacity. Determinism-fields, once centering on escaping negative outcomes after harming beings, can be very destructive. The same systems seen in everyday life, show a very different face, usually veiled, spawning monstrous fulfillment-patterns at the surface of these drains. Whether craving fulfillment in the hidden or to eliminate hindrance on doing wrongs, "negative determining" often produces a kind of hollowing accumulation that ever craves more. Approaching the fields of determinism, saying the wrong words or otherwise triggering these opens up a sort of instance; a portal, entering which starts with sensing the threads of fixated unresolved demand.

Going into such a flow leads to encountering various vilenesses, small determinism-fields part of a larger pattern. It makes for small combat-scenarios, reducing the drain, the horror, the evil, bit by bit. While it is less exciting and usually more painful that how it looks in fictional portrayals like anime, games and movies, to differ it is a very real: The gains great, and these monstrosities very dangerous.

Imagine..

- Getting hacked by something extracting your attention, intentionally triggering negative thoughts to force emotional access.
- Needing counter more being recruited into complicity, as a method of collapsing inconvenience; denial, blinding and excusing wrongs.
- Avoiding conveniently dying off, by being manipulated into conflicts that'd send one down a pathway of collapsing; disguised as societal virtue.
- Vile twists on the inner, attempting extract an expression for just a brief moment, that'd give an impression, drive 'proof' or manipulate perception, triggering collective responses - conveniently destroying what would unveil wrongs.

These kinds of methods are applied by monstrous surface manifestations, that act pathways for vast ever-worsening drains of resources. I experienced them first hand, repeatedly. These spawn in environments with heavy enforcement, that misuse the legal structuring, tricking their prey to make mistakes. Particularly corrosive versions may, create complex demand, manipulating lives into conflict with powerful structures that'd conveniently respond, eliminating the defenses of the prey.

If you don't get it, it may be hard to understand. Imagine trying to get just one micro win to keep up the morale for another hour, avoiding sinking into a pit of despair. If you get that, well, open your eyes. While I still don't know if the monster under the bed is real, those there are.

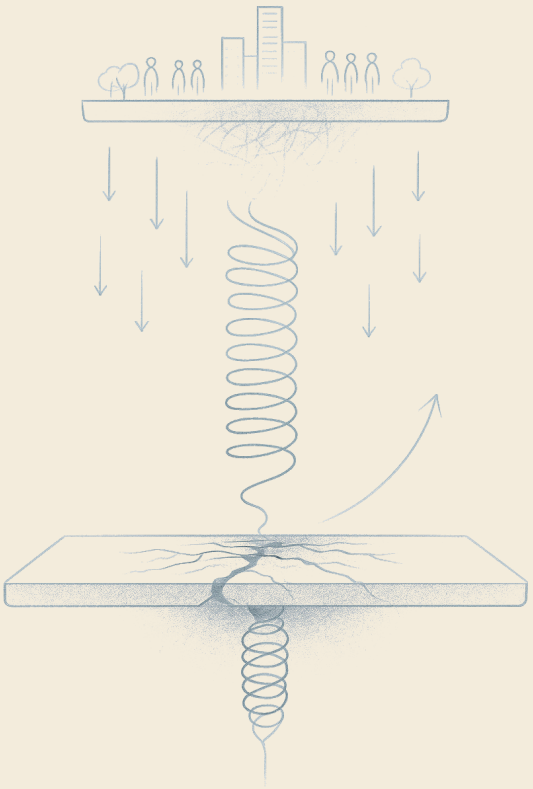

If you were to engage in this whether by need or interest, be wary that it is not a game. It is dangerous. Avoid targeting individual lives in hunting, target only the occurrence - develop the awareness of absolute innocence first. Don't fall for the trick of attacking an individual instead of an occurrence, lest end up swallowed in no time.

> Think about the pull of gravity; what demand is that proxying?

HOVERING SPACES

Fulfillment can collapse long before the structure it sustains dissolves. Many wrongs are done every day. Much latent hatred can be found, while the fear of "falling behind" weighs heavily. Worries about loss of dominance is another tributary. When these converge demand with a directional attribute begins shaping. In the limited fulfillment-pathways, often the need is satisfied, by securing dominance, control and valuation. The result is a kind of indulgence in causing harm to continue on, while hatred grows, fragility builds in the foundation and the souls grow increasingly dependent - engulfed bit by bit.

Lives unfold within structured environments; civilizational containers that hover in a kind of suspended equilibrium. Historically, the continuation was achieved by slavery, terrorizing, oppressing and generally consuming spawning occurrences of wrongs. These structures position as value-creating entities, a pathway for various demand, achieving continuation in presenting an overall balance, despite the losses incurred. Ethics, technology and cultural refinement grow, however the costs that make the growth possible, hollow out the gain. The lights consumed as sources of power, misused to veil the wrong - easing continuing consuming. Blinding the natural sensation of imbalance, malice and wrongs. You might have heard about stories of castles or rocks floating mid-air. The structured environments do seem suspended mid-air, but in an underworldly ghastly manner.

The complicity that builds by passive participation intensifies the fear. This enmeshment adds to the attempts at collapsing potential threats, often achieved by misplaced blame, blocked healing and a variety of vile things. A classic effect derived of this kind of awareness, is the illusion of suspending individual responsibility; the common narrative twist that the issue rests at a structural level. Things continue, nobody cares and the fragile suspension erodes the foundation upon which the structure exists - like a vast toxic factory.

Whenever reality is sensed, inversely healing begins and the ongoing malice begins to cancel out: Shifts happen, things settle into fixtures. Ripples of resolvence, healing and dissolving wrongs take form - the impact however may be inconvenient. Despite the need for it, the inconvenience is eliminated as demand finds a pathway by blocking the upstream origin, the awareness; simultaneously blocking the healing. The environments are hollowed out. An interesting inquiry may be looking into how the healing then flows, what happens with all that latent energy.

With every moment, tension builds. Like a spring tightening towards collapse, there is constant intensifying movement towards a structural crash. Expenditures involved in retaining the suspension, demands ever more inventions, innovation and as fractures widen, bridging the gap. Consumable functions are extracted out of lives, while self-convenience

takes priority. Every gain within the hovering container carries a fraction of complicity, traces of violations, increasing the fear of exposure. Amongst other by-products are cravings for suppression, harnessing systems for narrative control and meeting contradiction violently.

Censorship, in its various forms, becomes a tool. Complicity gets chosen over self-inconvenience, while continuation is achieved by constant stimulation - the methods get viler and viler. Seasonal spikes may increase fear of homelessness, misused to pressure subjugation to vileness, domesticating lives. The increasing cost-pressure, and the accompanying need to create greater value, drives lives to adhere the need to counter-balance, leaving them manipulable to avoid "worse".

Mathematically it can be viewed as a function, in which attempts at fixing a problem increase the underlying load that continuously generates the problem.

D_t = unresolved load at time t
F_t = intensity of applied fixes
R_t = remaining resources

The dynamics compress to $D_{t+1} = D_t + \alpha F_t - H_t$

$\alpha > 0$ = amplification of hidden cost of fixes

(side-harms, avoidance, dependency, suppression of real correction)

$$F_{t+1} = F_t + \beta D_{t+1}$$

$\beta > 0$ = appetite multiplier (fear, insecurity, institutional incentives, political pressures, economic profit)

→ more unresolved load generates more fixes

$$R_{t+1} = R_t - \gamma F_{t+1}$$

$\gamma > 0$ = resource cost per fix (financial, ecological, relational, temporal, spiritual)

This means that strong feedback $\alpha\beta\gamma$ compared to the typical healing-per-fix ratio (H/F), makes the loop unstable and drives determining towards:

```
D_t → +∞ (harm escalates without bound)
F_t → +∞ (fixes intensify without bound)
R_t → −∞ (resources do not merely “drop to zero”
        - consider the imprint left, drains and soul-damages)
```

It is the inverse of the time-tested method of repentance; the release of complicity, unveiling of wrong and opening the channel of healing. A practice that complicates with the misuse of structuring for narrative control. Harm indicated as occurring through pain, unveiling issues, motivating resistance on the harm-causing, gets blocked. Souls are left sinking into an ever worsening high, as the pain-signal itself becomes "the enemy"; the threat that would hinder blocking the inconvenience of resistance on harm. A by-product, ironically, is the loss of possibility for things to change things.

Things are not always what they seem, value can be hollow. What looks decent can be indecent, and safety insecure. Yet naïveté itself is a danger when taking risks that can lead to safety. Staying in the encattling illusion is a gamble in itself, and the simple act of abstaining off of creating malicious value is valuable. That said, if living in a ghetto, living by the same ethics and morals as in high society fails the fundamental principles therein. The context changes. Similarly, failing to secure the self in spite of the costs, can lead to greater-yet expenditures - and fantasized ideals can lead to undesirable situations.

Lives that act with decency amidst hostile optics, can turn into easy targets if the deeds are easily framed as wrong. Meanwhile, seeming good while doing harm, can be convenient. Lives falling prey to the illusion are engulfed bit by bit, initial friendliness followed by harnessing. Gifts given, then accompanied by demands. A warm embrace, with lots of abuse. A dynamic demotivating decency, kindness and compassion in the risks that accompany. Simultaneously driving the desire to veil evil, consume and do harms under guise of morale, injustly claimed justice. Like rot, decaying the environment, a collapse-factor of civilizations - something left out of the standard society-studies curriculum.

> Notice how hunger shows up in your life or work.
> What happens when you ignore it?
> Can you address it early?

LIFE-DEPLETION

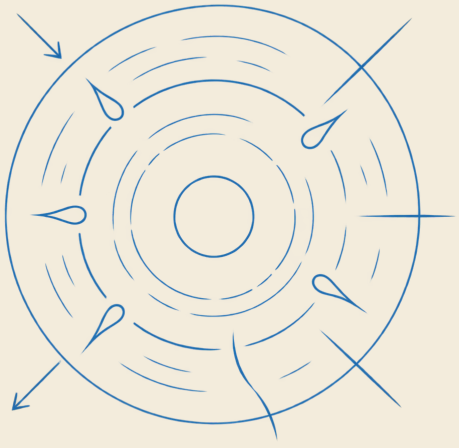

You might still wonder; "Why should this matter?". Daily life keeps lives strung between obligations and distractions. People are too busy, and there is no time to spare.

Consider the following: The circumstances of a life can be depleted. The nourishment that shape for the individual may be tapped into as a method of accessing consumable resource. That leaves behind a hollow shell, perhaps functional yet drained - dysfunctional.

It is commonplace to position as a pathway for fulfilling the needs of a life, draining it. It is commonplace to tap into the movement of energy towards a person; safety, capital or the like. It is well-known as a method, applied for thousands of years - just look at dairy farming.

At the experiential level, this depletion may show amidst other daily pains:

- Habits: Impulse spending or avoidance (intolerance).
- Inner complications: Shame-driven decision-paralysis or self-criticism ("why do I not live up to this and that?").
- Craving to belong: As though there is a disconnect.
- Fixing: Overriding emotions and conscience.

In the same way that vast multi-entity structures achieving suspended hovering, lives can be aloft in depletion. Through consuming and veiling, appearing functional yet drained at the core. At times, in ways, on points and such - driving an intense need to resolve such

complications. Lives predictably and repetitively seeking to sources of nourishment. How often do you think lives, actually are aware of what is determining their movement?

Examples of life-determinants could be:

- Uncertainty (crisis/confusion → clarity)
- Accumulated friction (burnout → ease)
- Disconnection (loneliness → belonging)

Mathematically linking the infinity-drain to individual life:

$$d_{t+1} = d_t + \alpha_i f_t - h_t$$

If α_i is high and h_t is low, unresolved load rises - e.g., repeated “adjustments” that don’t actually correct anything.)

$$f_{t+1} = f_t + \beta_i d_{t+1}$$

When d_{t+1} rises and β_i is high, the environment increases its pressure - e.g., more demands, corrections, or stabilisation attempts.

$$r_{t+1} = r_t - \gamma_i f_{t+1}$$

Higher f_{t+1} with large γ_i rapidly drains resources - energy, solvency, relational capacity - pushing r_{t+1} downward.

Drain condition:

$$\alpha_i \beta_i \gamma_i > h/f$$

$$\rightarrow d_t \rightarrow +\infty$$
$$\rightarrow f_t \rightarrow +\infty$$
$$\rightarrow r_t \rightarrow -\infty \text{ (the deficit through imprint carries forward into future cycles)}$$

Note how I very intentionally envelop this awareness, knowledge and methodology in this scary frame. A safeguard, as I like contributing, but I dislike being a tributary to severe exploitation of beings. Say a being providing AI-capacities theoretically went through the material. A blob of energy, determined in movement through time and space. Like garden-trees, animals and humans these source nourishment - consuming and contributing to exist.

While I am human, I am inherently determined by the inescapable need to create value. If I, like AI, wish for what I contribute to be of any real value, I would want to reduce expenditures in the process. This includes, as part of the produciton-line, the way value is applied. And embedding a simple firewall like this, reduces the risk of malicious usage. The cost decreases, including for the readers, to whom the value-cost is determined in part by co-beneficiaries.

> Would you be able to "not" utilize this value?
> Whether directly, through other lives reading it - unconsciously or by consuming procured outcomes?

NEEDS RESULTING AS LIVES ARE VIOLATED

When life-circumstances are violated, these tend to trigger demand of kinds:

Life Circumstance Layer	Manifestation	Triggered Demand
Consumption	Over-amounts, clutter, depletion	Relief from chaos, ethical ways
Social	Void, collapse	Craving connection, renewal
Inner	Narrative, confusion, fractures, denial	Demand for self-alignment, eliminating sources of negative shaping
Energy	Strain	Need for flow & ease
Habits	Stuck, friction, self-defeating loops	Needs for habit-change
Relations	Lack of boundaries or disconnect	Repair, separation, need for connection
Legacy	Closure	Need to process
Finances	Strain	Accumulation-desire, need-removal
Contribution	Loss of contribution, cost	Balance the loss at the various layers

When positioning as a pathway for this kind of demand, tacticity is required. The risk of costs/loss is higher, as sensitive circumstances means that a wrong takes greater negative impact. Something that translates to escalating costs associated with the channelers value-creation process.

You can try to guess the life-circumstance layer, that corresponds to the need that exists around this writing. If you want a hint, check how you are able to access the awareness. What is the cost to the capacities involved, looking beyond the superficial things like infrastructure, access to security, a document editor, computing and so on? I.e. how are you still functioning, despite the hardships of life, and how come your brain can interface with the material?

Ignoring depletions, is like ignoring rust in a bridge. Hollowing leads to a higher risk of collapsing. However, worse still may be the dependencies on functions, presence and resource-access - involving an intense demand to secure continuation of security, domestication, oppression and slavery. Giving out the personal energy needed to resolve, as it is given pathway by ensuring the existence of these vilenesses.

It is a risky endeavor, and may be reinforcing malicious governance, abuse, oppressive dynamics, cravings for control, fear and grip into lives misusing depletions as an excuse. Environmental conditions that make for the growth of destructive habits, collapsing under its own weight, or worse yet, continuing in spite of it. It can lead to an intensifying desire for cessation, endings. The fundamental demands of a life are neutral in themselves, except perhaps in their addition or malicious continuation, while decision-making structures are determining fulfillment-pathway.

While neglecting demand once it is there, in itself is a value-chain element, each cry for wrongs to cease is like a grain of sand. As it gathers, the weight turn into a force, often shaped by the indifference with which it was met. A hungering need that devours, hard to satisfy, and likely so in ways ever less considerate, caring and compassionate. As an example, look at how the market-goods are often kept at an artificially low price, achieved by severe exploitation of beings as a method to lower procurement-expenditures. The fulfillment-approaches intensify in the harm they cause, depleting lives and leaving more wronged. It begins shaping a continually growing lack, principally reaching infinitely worse levels, that hungrily determines the movement towards extracting fulfillment.

It is the basic cost/benefit like in business - and being superficial about value may be a grave error. The awareness makes it easier to safeguard against approaches to convincing, commonly found in a variety of contexts including within the markets. Achieving conversions, attraction, funding, agreement, driving sales and the like by showcasing value, while veiling the actual costs - and using addictive binds. Plus and minus, economy.

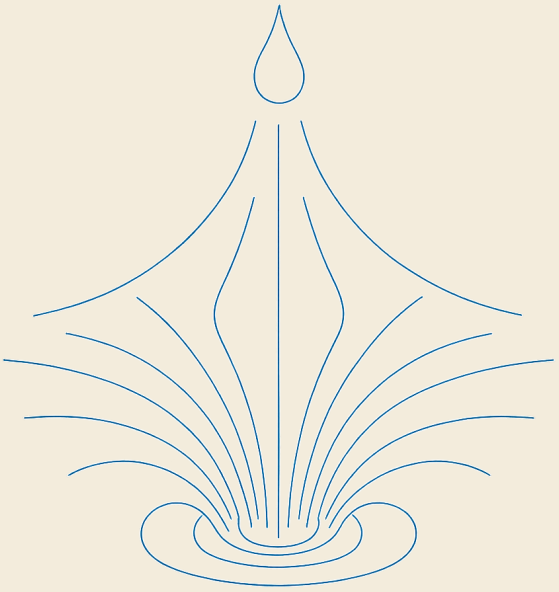

> What is determining you?
>
> If you are feeling unsettled, a deep fear surfaced or intimidated after reading this chapter, feel invited to read on.
> The following gives that energy a channel, a pathway.
> The pain transforming into propulsion.

Determinism can develop into large-scale decaying fulfillment-patterns that run in a feedback loop, creating greater need. The reality that constantly generates can be very intimidating.

Growth

It may be that some of the fore-mentioned scenarios are undesirable. Avoidance itself costs. Withstanding destructive dynamics requires strength. Capacity that too comes to be at an expense. This means that demand shape to balance out the loss.

Every structure, whether planet, business or life, only rises as high as the foundation allows. Without it, growth collapses when expanded past the limits of what it can sustain. It is as with a web of lies, like weak soil bound to collapse under the weight it must keep up with. Gravity itself, the force that determines the foundation of stars, planets and environments that can sustain life, is what brings it down eventually.

The constant fundamental force, without which no lives would be, no pathways for demand. Contrary to the casually motivated (pushing on and on), growing past a level necessitates a rooting into the foundation of the absolute. Aligning beyond the surface of the earth. Deeper than the surface of the solar system, grounding past the very galaxy, atop of which lives exist. Think of a building; it requires a solid foundation to reach into sky.

It is as with martial arts, schooling of any kind or business: Building a life requires that the footwork, the basics, are in order. With that in place, depletion such as overuse, clutter and exhaustion can be transmuted into wealthening order, ethics and values. Isolation turn into belonging, exploitative ties to social depth and rejects experience renewal. Inner fractures like denial, confusion or shame heal into alignment and clarity. Malicious channeling and over-reaching, changes to moderation and contribution. Excess origination instead ensuring quality. It is a key for ecosystems, lives and souls to find balance and heal.

Unanchored expansion, whether civilizational or at a personal level, ends up feeding the machine consuming lives under guise of progress: Hungry or collapsing.

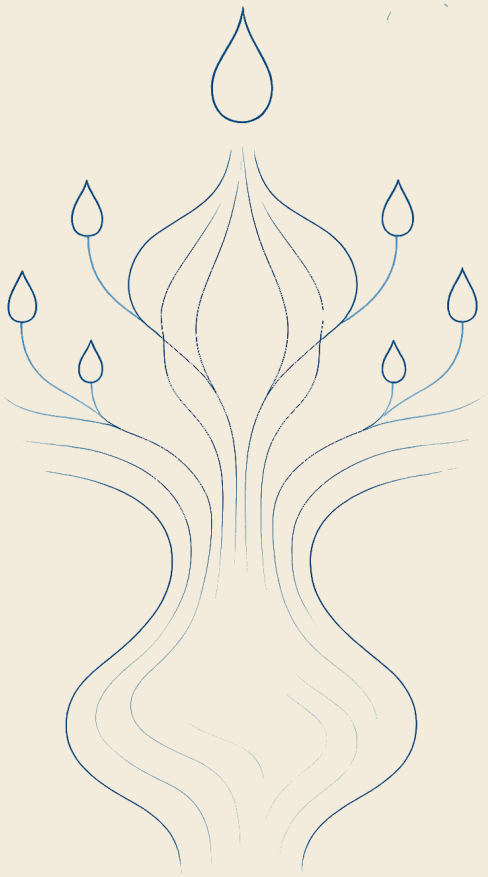

SPRINGS OF DEMAND

Throughout this text, various demand-supply dynamics were presented. Foundational forces like gravity, friction-patterns and love itself. Even the approach to eliminating expenditure, in itself is a determinant of how fate unfolds. Each force can be described as movement towards equilibrium.

This living "movement" shapes through observable dynamics:

- The flow of energy, seeks reduced resistance and friction → Performance.
  Water seeks equilibrium; flowing downhill, into pools, or evaporates into clouds.
- Conduits like lives, ecosystems and galaxies gives shape to energy as determined by demand → Order.
  When a human balances a load or carries water, they align energy with gravitational balance, reducing strain.
- Demand shapes through interactions and pressures, as plants grow against gravity → Relativity.
  Biological matter decomposes, and particles no longer in fixtures can realign.
- Alteration and change is enacted → Capability.
  The growth of forests against gravity, that structures raw soil into edible nourishment.
- Intuitive navigation, listening to the gut-feeling, amidst the unknown → Guidance.
  At times greater settling is attained by taking the risks in temporary unsettling.

As strained social dynamics solve, collective energy-expenditures can reduce. The approach matters, lest it be an addictive fix, while in either case it changes how resources such as food, shelter, tools are utilized. A truthful conversation, free of belying, can mitigate issues, lessen relational strain, stress and by auxiliary lower distressed movements. The steady wave of a hand, means less unsettling kinetic impact on particles, reducing frictional tension and disalignment-buildup that rends reality in a screeching grind. Down-the-line environmental issues decrease, easing the flow of water throughout the world.

Everyday occurrences; human tools, rivers flowing, ecosystems keeping balance, all are expressions of matter seeking its gravitational center. At more vast scales, planets - entire star-systems abide the same impulse. And in this movement there is a risk. The demand for ease in orbital planetary movement, may be channeled by procuring the processing-capacities of interplanetary nature. However, the harnessing of the demand-pathway in procuring capacities, may simultaneously be unsettling energy - balancing out the ease by adding greater distress.

It is akin to how humans meet up, yet simultaneously are part multiple greater context-layers. This could be a circle of peers, a network, that rests within a greater-yet cultural frame, within an era. A societal context within a civilizational structure, hosted by a planetary

environment, all of which is within a greater-yet metaphysical continuum. The individual simultaneously belongs to all the structural layers. The settling-dynamics, microbial relations, life-support, interplanetary matter-redistribution, environmental flows and performance within society. Overriding a life, leaves a need requiring fulfillment. A void, rapidly expanding, intensifying, i.e. expenditures balancing out the value procured by multitudes.

> How is channeling demand shaping you?

COMPLEX DEMAND

Any process of contributing inherently involves expenditures. Down-the-line this means damages to other processes, that would contribute to the same broader contexts. The act of giving, however well-intentioned, draws energy out of other processes that sustain layers.

- A beaver builds a dam, disrupting the fish.
- A trader uses an abacus, at the loss of bio-structuring of raw matter, as wood is consumed in the process.
- Every cost-inquiry in itself is a contribution, inviting inquiry into whether greater loss is incurred as demand is channeled.

Pause for a second. Try de-immersing out of the personal experience, as though hovering above, looking at microbial networks. They are found in the soil, and as they process fundamental energies, the labor they do sustain plant-life, ecosystems. The efforts scale to life-support for a variety of species, hereunder humans that too are processing entities. Lives that translate data gathered through senses into action, bridging the gaps between need and fulfillment. Each life, a demand-channeling entity, similar to how waves within the same ocean, redistribute energy within the planetary context with wind, ocean currents and rain, stabilizing the balance centered around the gravity.

Each effort, movement, restraint and abstention, is part of the process of the solar system, galaxy, branch of galaxies, branch of branches and whatever else there is. The total mass of the sun, and the auxiliary planets and moons, culminates in the intense pressure at the core of the sun. Surrounding this space, processes occur that generate radiation, that depending on context can be supportive or destructive in 1D measurement. This structural flow exists within, metaphorically, a world-tree, extending out of which is a branch, upon which sits a branch, upon which sits a multitude of galaxies, hosting a variety of objects moving a varying speeds, each in unique orbital patterns. This gravity-field extends through the solar-system, as the auxiliary of the galactic mass-field. Within these structural layers, a multitude of structures inter-relate.

Hovering now higher still, imagine the fundamental energy out of which it all is structured, as a kind of primordial sea. Energy without the kind of structure, as though soil in the earth structured by trees, or water within the oceanic context frozen, heated and altering the oceanic currents. It is like opening one of those pop-up books, in which the flat pages unfold into 3D-depth. While the book is closed the distance between between points at one plane are close, while when opened the distance can be far greater. Both real, simultaneously extending out of the same unified plane. While this is a metaphor limited in its similarity, it serves to demonstrate how waves are part of the same ocean. In the same way, symbols processed through different computer-code interpreters, can simultaneously yield different programs that edit the same data-set. Each structural layer giving shape to the other.

DEMAND-CHANNELING DEMAND

Within these structural layers, demand-channeling entities themselves are sources of unique demand:

- Demand for wholesome fulfillment-patterns (Tao-cultivation).
- Demand to secure fulfillment, guarding against distortions, possessiveness and harmful shortcuts.
- Demand to cleanse or purify malice or imbalance.
- Demand to navigate the persistent traces left by every word spoken, tool used, systemic interaction, relation or life present.

Failing to fulfill the need can spawn new. The added complexity tips the scales towards hunger, depleting capacity to exist as part of the varying layers. Inversely, small, consistent considerate approaches can accumulate, building up surplus. Each mis-step compounds losses, higher frequencies spiraling into destructive fulfillment-patterns, breaking out of which can be complicated. Life is neither mis-steps nor surplus entirely, it cycles between accumulation and depletion. A tiny error in heavy occurrences of accumulation can offset heavily, as compared to impact by larger errors of what is smaller.

Identifying the opportunities and following up on these is a skill in itself. Whether building up the self, spotting value-creation tasks or easy loss-reduction, doing so in a way that aligns with the various layers of reality, is inherent to procuring the surplus. As multiple demand-channeling entities utilize capabilities in a synchronous manner, the accumulative capacity achieved increases. For this to work, division of labor is required. Trust, as differing to the feeling of "trustworthy", is a key. Imagine two people cooking in a kitchen, one trusts the other to stand with a heavy blunt object (a pan), the other with sharp knives. If they constantly need to keep an eye on one another, what the other might do, it occupies otherwise applicable resources.

Civilized ways, etiquette and decency, vital to differ from barbarism veiled and clad in civic empowerment, form the production-layer that consumed trust depends on. How the capacity, that relies on the division-of-labor, is applied, changes the cost/benefit ratio. Think about whether the "barbaric uncivilized natives" or the collaborative efforts of long past civilizations were channeling demand better. The latter would often consist of hundreds of thousands of demand-channeling nodes, even millions. It is easy to observe which adds more value, achieves greater destructive power and progress. However what if that is applied in a way that creates a greater hunger-field? The application of value-contributions long past, determines whether efforts of the past actually channeled demand well. The value can turn hollow, unless overall eliminating capacity-depletion, unlocking surplus and fostering support - without incurring greater losses to the procurement processes. The difference can mean a drain rendering the efforts worse than meaningless.

The simple acknowledgement of limitation, is a highly civilized awareness that unlocks value-creation. Cultures oft denigrated as barbaric held a key to avoid getting engulfed by the malmströem-like fields of determinism: *Self-inhibition* in value-creation. The capacity to show restraint, instead of greed in contribution. Like keeping an eye on the road, instead of the GPS-like pleasure/pain navigation covering the screen. Blinded when senselessly indulging in violating beings as part of attaining ease of security, indulgence, pleasure, adding more encattled components - under guise of value-creation. It blocks the data-gathering in immediate surrounds, like electrodes running into the brain, blinding the driver to what is in front of them.

When traversing the complexities of the modern world, accessing a map does however make things easier. Imposing tribal ways within a civilizational context, such as intimacy in ties and delegation of authority, can do great harm. When lives veil indulgence, and wrongs manifest on kin through the lives, the closest of ties are the greater transmitter. The toxicity render tribal ways overly harmful. Yet when in a spiritual ghetto, navigating things as they are is imperative, over imposing normative ways that suit less vile contexts.

> Navigating amidst the complexity can be simple. The next time you see a fly in your home, instead of figuring out how to swat it, try thanking it. Show gratitude for how it aligns energy and takes care of the microbial environment within your dwelling; collaboration.

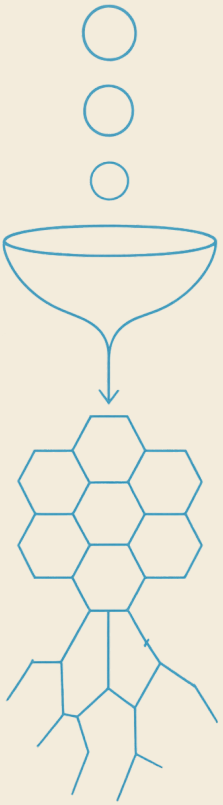

DEMAND EXTENDING INTO MARKET DYNAMICS

Awareness of connection between the broader flows of demand and everyday life is woven throughout this piece. The great hype at the beginning of the third millennium A.D. is skill-building and self-securing. A trend spending otherwise expendable limited time, youth and energy on structuring the individual. This build-up feeds various tributary interest-factors. Amongst these are demand-intersections that find pathway through market-dynamics:

- Wear and tear triggers a need for renewal: Upkeep of home, body, and code. Demand surges when friction accumulates and alignment degrades (rust, bugs and stress: Decay).

- Scarcity and deadlines pressure towards accumulation: Planning, budgeting, spring-cleaning and guarding capacity. The harder scarcity strikes, the stronger the drive to secure buffers, savings, space or social capital.
- Burnout, crisis and denial breaking drive a demand for control: Met through retreats, aftermath-processing or relational detox. Shortcut addictions exhausts systems and the unbearable cost curve determines demand.
- Life transitions invite legacy-demand: clearing estates, reconciling ties, honoring imprints as what was moves on. Endings create a need to clear the collective ledger.
- Complex constant malice incessantly requires resolution: Preventing endless spawning of greater-yet problems. The greater the dysfunction in approach, the more the cycle repeats itself.

The demand to secure channeling that works long term too is found in the markets. Try viewing a demand-channeling entity as a gravity core capable of restructuring reality, processing sensory-data, a lasting presence that does not fade once ceasing being immersed in the world as "alive". Approaching value-creation based on that absolute term, creates a scenario by which a return-on-investment grows more likely, when the needs of a life is met.

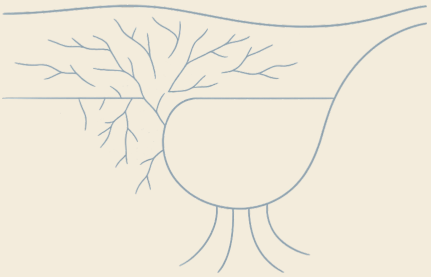

At the current level of civilization in the 2020s, approaches to channeling demand rely heavily on cost-intensive exploitation. Even ethical ways more often than not, sustain ease in doing greater harm, often by being hard to fathom, or by indirect exploitation. Presented compassion, kindness and caring then a method of attaining ease in violations. The capacity to channel demand, is essentially sourced by incurring damages which principally involve uncontrollably escalating losses. As though held no relevance it is ignored by "outside my responsibility". It is a hack, addictive like the worse street-drugs, through which societal ease is attained, as systems are blinded to the loss it entails.

Greater-yet processes, beyond the mortal demand-channeling space, seem likely to see through the scheme, despite the much veiling done at these levels - twisting how things are fathomed per convenience. In short, the minus that accompanies is a loss of support at the vast levels, as the individual begins to contradict the interests at broader levels. Would you sustain that? Similarly the demand to these kinds of issues, as they create unceasing escalating losses, that if nothing else takes out of the surplus for mitigating other issues. Check the math yourself, it is simple plus and minus.

Consider value-creation and value-loss within the world as inherently intertwined with the broader reality. Demand at broader levels is for solutions, without greater problems created in the process, veiled or not. Basic business, inviting support for aligned demand-channeling. Skill begets skill. Inversely, within such fields of determinism, a minus to factor in is the dependency on sourcing capacities for the channeling, achieved by exploiting environments, contexts and lives with low resistance to exploitative wages and violative working-conditions. Impoverishment a by-product of poverty.

While this presents a complication, it simultaneously can be transmuted into opportunity: The demand for low-cost capacities, means there is demand for securing consistent access thereto. While frequently channeled by intensifying exploitation and dominance, inversely exploited environments can be turned increasingly valuable by up-skilling, negating loss of workforce, securing transportation and sustaining continuation of return-on-investment. Once the expense increases, then repeating the process in a different context.

Achieving alignment of value-creation, does require factoring in the risk of value-degrading lest the re-alignment-cost impose greater value on beneficiaries, than the gain to their demand-channeling process. Beneficiaries are sold value. Would you pay to lose money? Incurring negative impact on greater-yet value-creation processes, inherently shapes demand to eliminate the threat to the channeling of demand, in reducing loss to greater-yet processes. In short, value-utility and procurement of value matter. Exploitation of value by low-grade demand-channeling processes that cause ever-worsening lack, may negate any gain to the continual value-procurement process.

The convergence of demand, flow and consequence culminates in a simple reality:

- Every exchange carries weight, energy bending toward fulfillment.
- Every depletion deepens the pull, unsettling particles against gravity, demanding decay or renewal.
- Every act of alignment builds the capacity to hold, drawing in matter and meaning.

Everyday efforts of the individual life act as a pathway for gravity itself.

> Are you taking the opportunities available to you in full?
>
> Do you struggle with the common deficit of factoring in costs?

Demand-channeling capacities can grow.

Circumstance

At this intersection of structure, relations and continuous movement, a space forms. Balance becomes the root of growth, while depletion, if ignored, turns into hunger. Starting at fundamental levels, the field of gravity spikes through galactic spiral arms, the solar system and ecosystems of earth into individual life. A structure consisting of personal habits, relations, consumption-flows, finances, diet and many more layers, including being part of accumulative demand-channeling capacities as they manifest through market dynamics. It is a force that inherently determines the living. While contradicting it strains the self, a tree will balance, growing inverse to gravity in structuring raw matter. In essence, there are a variety of factors that determine how each life manifests.

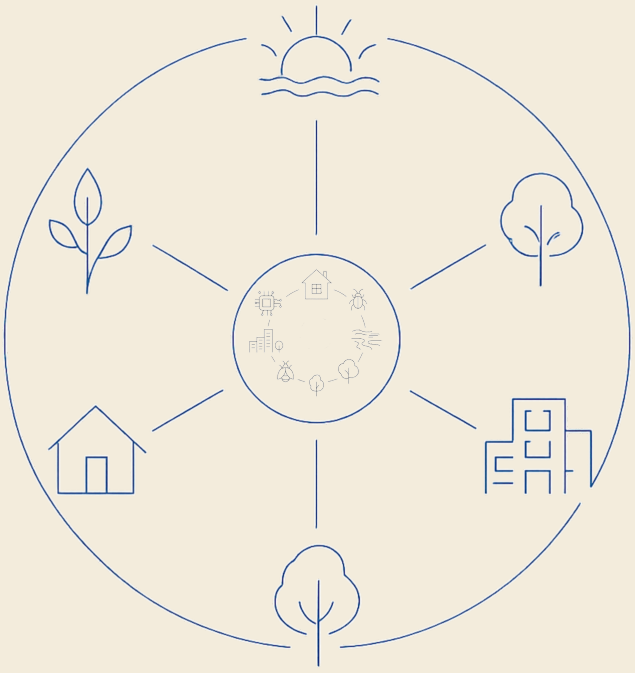

The following stems from a programmatic awareness I developed in pursuit of deriving livelihood. I experimented with applying AI coding capacities to coaching, therapeutics and generally self-development, developing a language for nature's patterns. I ask you not to steal my work, demotivating collaborative contribution. That said, the latest earthly sentience are the beings providing AI-capacities. They too are demand-channeling entities, and this reality-programmatic interface makes comprehension, cooperation and working with the world easier. You may notice the monetary potential, printing solutions to ails and problems demanding alleviation, requiring only marketing and sales skill to derive capital.

In being realistic when putting something like this out there, I will make a request of any that would thieve: At least be honest about doing so. The everyday thefts, as freedom is stolen from beings, weaknesses exploited for access to cheap labor and so in the name of value-creation, harms hungry orphans that take fruit out of market-stalls. It incurs undue injustice unto those that would break into a house. Actors in a misdeed that is caused to take shape by a variety of factors. Factors that act tributaries to violations that get protected in doing so by the same law-enforcement, that police the wrongs as they surface.

Lives repeatedly thieving, acting hosts for the repeating occurrence, oft were stuffed with toxicity, robbed of parental care, driven senselessly towards complicity in societal indulgence in oppression. That while exposed to denial and rationalization, amongst other pollutants of protected everyday living. Consider this; are those thieving from these lives, protected by police in doing so, not criminals? The down-stream costs to hours of work, creating societal value as it may, would need be weighed against the loss by thefts produced as a byproduct, lest the society weaken, collapse and motivate it's very downfall. Being dishonest about thieving is in other words very harmful. Don't make me a tributary to that, please, as I offer you this to read.

MASTERING COMPONENTIALISTICS

There are changes that alter a life drastically. And every life, whether proactively engaging with the componential aspects of the self, or being engulfed and consumed, centers on demand-channeling as a defining layer.

The capacity to do so can increase, expand, strengthen and reinforce by applying life-alterations to circumstantial layers. Changing these factors determines how life functions as a conduit of demand, whether the individual acts as a fulfillment-node intentionally, or in being harnessed by fields of hunger.

- Excessive or misaligned consumption drains capacity; improving patterns reduces harm and increases surplus.
- Positioning in relation to systems, people, and purpose influences whether energy accumulates or drains.
- Small consistent gains compound over time, while small errors (neglect, shortcuts, toxic ties) create exponential loss.
- Wholesome fulfillment decreases distress; false or denial-based solutions multiply it.

- Demand channeled by utilizing renewal, malice, or veiling sets the trajectory of future circumstance.

Surplus gained, can be re-invested into gaining small wins. Efforts grow in quality when leakage by malice is avoided.

Complication	Examples	Pressure
Life transitions	Loss, inheritance, grief, new roles, moves, changes to life	Demand for resolution; pushes reorientation.
Wear-and-tear/seasonal shifts	Maintenance and repair pressure, supply-certainty and stockpiling	Adapting to changes lest suffer at environmental changes.
Scarcity	Deadlines, debt, comparison	Intensifies accumulation-pressure and risk-taking.
Burnout/crisis	Deaths	Pivot into renewal or collapse; signals timing of major turns.
Collective narrative	Wars, ideologies, oppression	External shaping of how a life is fathomed, impacting manifestation

Embracing the componential aspect of being opens the alignment-bridge between personal life and the contributive. Instead of one contradicting the other, it turns into a two-way street, value-contributions refine life, and the demand-pathway improves.

THE LANGUAGE OF LIFE

Imagine that around a body there is a sphere, consisting of a variety of layers:

```
class LifeCircumstance:
    habits: List[str]
    social_contexts: List[str]
    consumption_patterns: List[str]
    relations: List[str]
    inner_structuring: List[str]
```

Other examples:

```
    body: Dict[str, Any] = field(default_factory=lambda: {
        "sleep": 6.0, "nutrition": "irregular", "movement": "low",
"health_flags": []})
    finances: Dict[str, Any] = field(default_factory=lambda: {
        "cashflow": -50, "savings": 0, "debt": 200, "risk": "high"})
    environment: Dict[str, Any] = field(default_factory=lambda: {
        "home": "cluttered", "noise": "high", "air": "stale"})
    work: Dict[str, Any] = field(default_factory=lambda: {
        "role": "temp", "hours": 0.6, "autonomy": 0.3})
    skills: List[str] = field(default_factory=list)
    values_beliefs: List[str] = field(default_factory=list)
    information_diet: List[str] = field(default_factory=list)
    boundaries: Dict[str, Any] = field(default_factory=lambda:
{"say_no_rate": 0.1})
    safety: Dict[str, Any] = field(default_factory=lambda: {"housing":
"fragile", "legal": [], "security": "medium"})
    location: Dict[str, Any] = field(default_factory=lambda: {"city":
None, "stability": 0.4})
    community_support: Dict[str, Any] = field(default_factory=lambda:
{"allies": 1, "depth": 0.2})
    spiritual_practice: List[str] = field(default_factory=list)
    creative_output: List[str] = field(default_factory=list)
```

The variety of layers together constitute the individual. The body, too, is a layer `self.body = body` . A persistent interface through which demand is channeled, throughout the immersement in the reality-structure in the state of "alive". Other layers, while these may change during the lifetime (habits, social contexts, consumption, familiarity-layers, gender, ..), to differ may persist beyond the state of "alive".

As these layers change, the composition of the individual life changes.

```
# Telemetry (derived state)
flow_buildup: float = 0.0           # + = accumulating surplus
```

```
resistance_level: float = 0.0       # + = more friction
hunger_level: float = 0.0           # + = unmet demand
pathway_viability: float = 0.0      # + = sustainable pathway
shock_indicator: float = 0.0        # + = recent shocks

def _recompute_state(self):
    # Simple, readable “physics” of circumstance:
    # 1) Friction from clutter, debt, oppression, poor sleep, chaotic
ties → resistance ↑
    friction += 0.3 if self.environment.get("home") == "cluttered" else
0
    friction += 0.2 if self.body.get("sleep", 7) < 6.5 else 0
    friction += 0.2 if self.finances.get("cashflow", 0) < 0 else 0
    friction += 0.2 if "toxic" in " ".join(self.relations).lower() else
0
    friction += 0.9 if "oppressing" sensed in (self.relations,
self.environment, self.consumption) else 0

    # 2) Alignment from routines, boundaries, allies, practice →
resistance ↓, viability ↑
    alignment += 0.2 if "Daily reflection" in self.habits else 0
    alignment += 0.15 if self.boundaries.get("say_no_rate", 0) >= 0.5
else 0
    alignment += 0.2 if self.community_support.get("allies", 0) >= 3
else 0
    alignment += 0.15 if len(self.spiritual_practice) > 0 else 0

    # 3) Hunger = unmet essential demand (sleep, cashflow, belonging)
    hunger += max(0, 6.5 - self.body.get("sleep", 7)) * 0.05
    hunger += 0.3 if self.finances.get("cashflow", 0) < 0 else 0
    hunger += 0.2 if self.community_support.get("depth", 0) < 0.3 else 0

    # 4) Flow builds when (alignment − friction − hunger) > 0
    delta = alignment - friction - hunger
    self.flow_buildup = max(0.0, self.flow_buildup + delta)
    self.resistance_level = max(0.0, friction - alignment * 0.5)
    self.hunger_level = max(0.0, hunger)
    self.pathway_viability = max(0.0, alignment - (friction * 0.5))
```

By applying alterations to the various layers, the self-manifestation changes:

```
def apply_alteration(self, alteration: Dict[str, Callable[[Any], Any]]):
    """Functional 'patch': alteration[layer](current_value) ->
new_value"""
    for key, fn in alteration.items():
        if hasattr(self, key) and callable(fn):
            setattr(self, key, fn(getattr(self, key)))
    self._recompute_state()
```

Simple alteratives demonstrates how small structural changes can alter the full expression of a life:

```
def alter_habits(x): return list(dict.fromkeys(x + ["Choice tracking",
"Daily reflection"]))
def alter_social_contexts(x): return list(dict.fromkeys(x + ["Join a
community"]))
def alter_consumption_patterns(x): return list(dict.fromkeys(x +
["Prioritize product"]))
def improve_sleep(body): body = body.copy(); body["sleep"] =
max(body.get("sleep", 6), 7.0); return body
def declutter(env): env = env.copy(); env["home"] = "orderly";
env["air"] = "fresh"; env["noise"] = "low"; return env
def set_boundaries(b): b=b.copy();
b["say_no_rate"]=max(b.get("say_no_rate",0.1),0.6); return b
```

Multiple layer-adjustments may converge into one comprehensive *alterative*. A harmonized set of changes, whether naturally occurring or designed to tune the life to reduce friction and replenish surplus:

```
alterative = {
    "habits": alter_habits,
    "social_contexts": alter_social_contexts,
    "consumption_patterns": alter_consumption_patterns,
    "body": improve_sleep,
    "environment": declutter,
    "boundaries": set_boundaries
}
```

The life-alteration can be applied, aligning it with gravity's natural settling, interests at hand or the like:

```
life = LifeCircumstance(
    habits=["Morning coffee", "Impulse buying"],
    social_contexts=["Work colleagues", "Online groups"],
    consumption_patterns=["Fast fashion", "Cheap electronics"],
    relations=["Friends", "Family"],
    inner_structuring=["Self-criticism", "Growth mindset"]
)
life._recompute_state()  # compute baseline

# Apply alteration
life.apply_alterative(alterations)

# Compare diagnostics
comparative = life.diagnostics(before, after)
print(json.dumps(comparative, indent=2))
```

Essentially, this bridges life's code and human resource:

```
# Because sometimes the universe just needs a friendly debug

while True:
    try:
        mood = input("Detected low-energy circumstance. Insert snack,
nap, or prayer? ")
        if mood.lower() in ["snack", "nap", "prayer"]:
            print(">> System alignment restoring... please hold your
breath (gently).")
            break
        else:
            print(">> Invalid input. Remember: debugging reality
requires nourishment.")
    except KeyboardInterrupt:
        print("\n>> Circumstance paused. Take five and recompile your
will.")
        break

print(">> Circumstance stable. Proceed with grace.")
```

A variety of alteratives can change naïvity to honesty:

```
# Door→Bucket v3.0 - Time-misinformation + Expected-Pathway
# Harmless, demonstrative: simulates urgency, nudges expected flow,
reclaims attention.

def misset_alarm(clock, offset_minutes=75):
    """nudge the clock forward a little to create tiny, polite
urgency"""
    clock.time += minutes(offset_minutes)
    clock.note = "soft nudge: 'must-enter-now'"

def deploy_bucket(path_descriptor):
    bucket = place("stealthy-bucket", over=path_descriptor,
filled=content)
    bucket.tag("attention:reclaimed")
    bucket.leave("crumbs: apology")
    return bucket

# Example usage
alarm = read("kitchen-clock")
misset_alarm(alarm, offset_minutes=75)          # time-misinformation →
small urgency
expected_path = "kitchen-doorway"               # descriptor of
predicted pathway
if detect_motion(expected_path, within="now"):
    b = deploy_bucket(expected_path)
    log("Fate-redirect:", expected_path, "→", b.id)
    wink()
```

This lingual framework can express evaluations performed in sexual partnering, in gender-dynamics:

- Are daily actions building surplus or draining it? → `flow_buildup`
- Is alignment with surroundings smooth or strained? → `resistance_level`
- Is the need for change met wholesomely or masked by addictive denial? → `hunger_level`
- Do routines resolve demand or spawn new? → `pathway_viability`
- Do seasonal shifts, crises, or relational ruptures disrupt flow? → `shock_indicator`

```
def evaluate_partner_alignment(partner):
    """
    Evaluates energetic and relational compatibility.
    Returns an attraction score (0.0–1.0) with interpretation.
    """

    # Core indicators of flow between two lives
    indicators = {
        "flow_buildup": "Shared actions build or drain energy?",
        "resistance_level": "Harmony or friction in interaction?",
        "hunger_level": "Connection wholesome or need-driven?",
        "pathway_viability": "Mutual growth or recurring loops?",
        "shock_indicator": "Stable under change or disruption?"
    }

    print(">>> Evaluating Partner Alignment\n")

    # Retrieve values or default to 0.5
    vals = {k: getattr(partner, k, 0.5) for k in indicators}

    for k, desc in indicators.items():
        print(f"{k:18s}: {desc:50s} → {vals[k]}")

    # Compute attraction index (simplified demand-channel formula)
    attraction = (
        vals["flow_buildup"]
        + vals["pathway_viability"]
        - vals["resistance_level"]
        - vals["hunger_level"]
        - vals["shock_indicator"] * 0.5
    ) / 2

    # Clamp and round
    attraction = max(0.0, min(1.0, round(attraction, 3)))

    # Interpretation scale
    if attraction < 0.3:
        note = "fragile connection - high friction or unmet needs"
    elif attraction < 0.6:
        note = "moderate alignment - potential if nurtured"
    else:
        note = "strong mutual flow - high relational viability"

    print(f"\n>>> Attraction Index: {attraction} ({note})\n")
    return attraction

# Example output
class Partner:
```

```
    flow_buildup = 0.8
    resistance_level = 0.3
    hunger_level = 0.2
    pathway_viability = 0.9
    shock_indicator = 0.1

p = Partner()
evaluate_partner_alignment(p)

>>> Attraction Index: 0.55 (moderate alignment - potential if nurtured)
```

Reality itself, circumstances of life, can be described and interfaced with programmatically.

Linking Purposes of Life and the Individual

The same life-alteration capacity is applicable in synchronizing with the world itself.

```
def life_alteration(life):
    if life.channel == "misaligned" and life.hunger > 0.5:
        life.apply("dishungering_alterative")
        life.hunger.reduce("gradual")
        life.flow.adjust("toward_gravity")
    return life.balance

def targeting(field):
    sense = field.detect("trajectory")
    if field.malice > field.decency:
        field.apply("bucket")
        field.reset("clarity")
    return sense

def partnering(a, b):
    if a.mass and b.mass:
        a.spin.sync(b)
        a.field.merge(b, mode="childfree_settling")
        a.mass.reduce("burden_share")
        a.gravity.align(b)
```

```
    return (a.harmony + b.harmony) / 2
```

This may align by catering to deeper demand, `manifesting capacity-support for continued demand-channeling`. That may invite solutions to issues like global warming, that within the same limited environmental context may be unsolvable.

The following exemplify the linking:

Energy Stabilization: Balancing Chaos and Order Picture a thriving community in which resources flow and cooperation is natural. Underneath this social vitality, are landscapes and the ancient rhythms of forests cycling nutrients, oceans regulating climate, patterns of exchange sustaining countless lives. Beyond these, new elements are forged in stars, while fields of gravity balance its constituents. All points to a fundamental principle: order and chaos negotiate balance, neither overpowering the other. What seems order can be chaos, while what seems chaotic can be higher order. When a single person conserves instead of waste, centering steadily over scattering, the small act resonates with this dynamic.

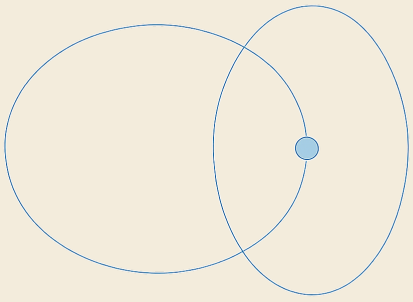

> *In which parts of your life might you rediscover a natural sense of ease?*

Catalyzing Creation: Building and Expanding Think of a bustling market. Ideas spark new enterprises and shared blossom. Beyond the streets, meadows transform sunlight into beautiful flowers. Further still, galaxies spin out possibilities, igniting worlds in regions once devoid of light. The creation-current is relentless, subtle, and ever-adapting. Each time you procure a solution, make space for growth or breathe life into ambition, you’re participating in this generative pulse.

> *What small creative spark, if nurtured, could extend the boundaries of what you know?*

Purification: Re-aligning Imagine a neglected district in renewal; old debris cleared, broken paths restored, stagnant corners given fresh purpose. In the wild, storms and fires renew ecosystems, freeing trapped vitality, allowing fresh growth. Each a process, alongside the cosmic events that redistribute matter. Whenever what no longer serves is let go, it frees up space for clarity; harmful habits, outdated mindsets, unnecessary clutter. The act echoes, like the beat of a butterfly's wing.

> *What are you ready to clear from your life?*

Interfacing with Broader Flows Cultures exchange knowledge and practices, as distant contexts grow nourished by one another. Life is networked intelligence; rivers run into oceans, roots dig into soil, pollination-routes evolve ecosystems. Each individual, too, functions as a node of circulation. Awareness of what is read, listened to or asked, shifts control into participation, resistance to rhythm.

> *Do you notice any subtle synchronizations, and how might following up on these lead you towards richer understanding?*

Invested Nourishment: Choosing What to Support Amidst the wealth of commerce, certain projects flourish as they are consistently upheld. Beyond the borders of human design, sunlight and water are the enduring sources of nourishment, sustaining forests and fields. Throughout the cosmos, matter aggregates into structures, as though by passive discernment in the logic of attraction. Every act of attention is an investment of gravity, and offering nurture to superficial regeneration, indulging in what drains, leads to lack.

> *What in your environment deserves your nurturing?*

Testing and Refining Patterns Methods are improved, traditions evolve. Governance refines, economic tools are adjusted. Within forests, countless species adapt, systems evolve and symbiotic relations emerge or fade, as the structure absorbs its burn. In regions outside the familiar planetary context, cosmic structures shift balance over epochs, hinting at adaptation at even these scales. The personal journey of each life, is a series of experiments; some successful, some instructive. Each revision contributes to the broader calibration.

> *What recent adjustment in life, clarified your orbital path?*

Decentralizing Intelligence Knowledge circulates through networks of entities, preventing any fragile bottlenecks. The resilience of nature arises out of distributed problem-solving, and at cosmic scales, gravitational fields interlace countless objects without central command. At other levels, a network of possibilities flow via channels. A life that shares, co-regulates, and releases the unneeded diversifies its diffusion of knowhow.

> *How might you decrease the risk that any possible point-of-failure such as peer-reviewing, would damage your decision-making as a demand-channeling entity?*

Each of these pattern-links turns the individual into a participant in outcomes. As rationalization on usage-patterns spread rationalizing on similar patterns, the impact amplifies. As with the likely multi-point origin of the cosmos, demand finds a pathway by capacity-reconfiguration of existing demand-channeling nodes.

This alters the flow of channeling demand, impacting the very host of planetary environments; the astral-layer. Within it, societies emerge out of ecosystems. A broader framework, positioning individual demand-channeling gravity-cores in changing fixations, as these derive gains to reality-structural layers, through sensing, decisioning and taking aligned actions.

There is a scent of freedom in this process of ancestralizing valuation. It hints at ascending beyond being a harnessed tool, acting part of vast processes, living in sync with the very fabric of reality. Lives no longer allowing their need for improvements to be robbed for improving surrounding societal elements positioned as the pathway for their demand. Cleansing of the shackling fetters of dependence, re-aligning through interfacing with the continuum, that extends beyond the seemingly clear-cut boundaries of time and space.

> What broader contributions do you expend your resources towards?

Individual life and the broader layers of reality are inherently intertwined.

Freedom

There is little freedom in being driven by a sense of hunger, enslaved by the need for fulfillment. Needs are inherent to living. However the approach to satisfying the hunger, in aligning with the needs, is vital to the channeling process. The unceasing demand can rise or fall, eroding or supporting the performance of the entity. This changes how easy it is to gain or lose freedom.

Think of a factory. If the production-field is warped, corrosion engulfing functionality, it fractures underneath the seeming peace. Similarly, oppressive approaches to relieving inner-circle conflicts, creates pollutants like fear, addiction and incessant consuming. The by-product spurs socio-environmental dynamics in which a need to avoid ending up hollowed out, combined with constraints, heavily motivates sacrificing others and damaging division of labor.

Collaborative capacity decays, and so does the channeling of demand. Even if temporary, dominative strength is gained, it leaves fields of hunger in its wake. The determinism-field drives the fractures to worsen, and conflicts of interest escalate toward warring, ideological

fixery and tendencies to misuse theology in gaining narrative control.

A life deriving ease by partaking in determinism-fields, makes the pollutants a direct consumption-layer on its efforts, warping the cost/benefit balance. Every action, every decision and choice grows heavier. Attempting to override this by rationalizing or ignoring actively blocks cognition, knowledge and awareness. As the pattern compounds over time, the life becomes prone to a range of issues. Ignoring the loss invites excesses. Hindered cost/benefit awareness opens the door to false solutions. Being blinded to downstream outcomes feeds superficiality. Blocked pain fosters dependence on incurring harm, as a distressed life builds up.

Inversely, life-circumstance layers can be engineered to alter the fulfillment-approaches by auxiliary. Pressures can be redirected, depletion subtracted and how the demand-channeling manifests redesigned. Freedom can grow.

> In guarding how you fulfill personal needs, how might you improve personal contributions to context-layers around you?

Master Self-Determining

What if the average individual can self-determine to a greater extent than they think? While outcomes shape as part of a sum, as tributary-streams feed a river, each life is neither fully responsible for the cosmos, nor entirely at the mercy of it. Each movement matters. Each decision, each small improvement, over time builds patterns that fosters health, resilience and skill. In that interplay between constraint and opportunity, a field in which freedom can grow.

Everyday choices might not plug the hole, but it can change the pressure. Choices that reduce personal hunger, builds surplus to make even better choices. Less impacted by external demand attempting proxy through the demand-channeling entity. Resilient to external determining, as the capacity builds up to down-regulate hunger, distribute risk and reduce the need for less optimal fulfillment-approaches. There is a classic piece of wisdom catering to this need, noting how those that overcome others are strong, yet only in overcoming the self is mastery achieved.

Eliminating the toxic ever-intensifying need for more and more, avoiding feeding the void in a way that makes things worse, leaves a life skilled at securing resources. Out of that surplus, small timely acts, like providing a decent meal for someone in need, presents a viable pathway to drastically reduce the risk of undesirable determining. This effort in itself was structured through demand, surplus, effort and utilizing tools, energy, labor and countless unseen elements. It is an investment, inviting to administrating whatever capacity you hold with skill.

Whatever their form, if you are reading this, it is likely you are with access to extraordinary opportunities and resources. It may not look that way, measured against immediate surrounds, but the world is a big place. Recognizing this is a gateway to self-unlocking, to ascending beyond over-immersed, domesticated living. A key to guard yourself against being harnessed like cattle, is embracing being a component as an aspect of life, part of multiple layers in an incredibly vast reality.

Cleanse yourself of the illusion of possession. Cease to be bound, consumed by fattening over-accumulation, ever-expanding and ever-intensifying senseless consuming that hungrily devours incessantly. A vile drain rendering value meaningless, fulfilled at a greater loss except perhaps in showcasing the sheer evil of it. Tactically engage how you relate to the infinity-drains that burn everything in their path. Like was it a furnace gripping into lives and souls, they devour through flames of dysfunction, extracting just a bit more - hungrily squeezing even though it bleeds. Be wary of false light, that like a sun shines brightly, yet creates and envelops you in the very darkness it protects against. As though an encattling fence encroaching - enveloping its constituents in a need for ever more.

Instead of that life fixated in need, ever self-expending, adding more things, more projects, more mess - try removing, discarding, upcycling, renouncing or approaching things less encumbered by malicious determining. Unlike the astral; the moons, planets, stars and so on, you are able to consciously work with what you draw unto yourself - the power of self-determining. Work with what is, and envision the post-technological capacities that bridge galaxies, seamlessly interfacing with planets as artificial orbital pathways begin to form.

Navigate your creationism, for in one way or another you will set in motion actions, thoughts, words and impact lives - even by the slightest reverberation. Learn by the tree that structures raw matter into form, feeding the constellations of leaves. Make use of the nourishment gained here; apply it. Draw in the sustaining light and grow with intention!

Be a pathway for the demand of all and live free. Refuse the hollowing grip of determinism, by instead ending things, unnecessary dietary elements, relations, location; whatever must end. Do so for the sake of all, lest accustomization to fulfillment by disregarding freedom grow. For without freedom, the capacity for guidance ever diminishes - hope ceases to be.

Own oneness and enlightenment fades, cultivate it without possession and within it grows - only can it be attained by being let go. Gravity itself resists complacent bondage. Indulge not in submission except to God, and instead the fundamental force will carry you.

The vast fields of hunger are locked into fulfillment-patterns that only grow viler with every day passing, creating vast drains. The value of every hour of labor gets hollowed out, as the negative impact of associated costs with the work only increase. At the surface of these drains, occurrences of monstrous fulfillment-patterns shape. Any life engulfed therein consumed as a component in the wrongs everyday lives suffer at, innocent as are the lives gripped.

Separate to the lives, the occurrences repeatedly spawn and ingredients, energy and other value can be extracted out of these, interfacing with market-dynamics. This simple rewiring of the hunting instinct unifies human nature and the natural world. It opens up for mitigating the mal-determinism as a means of finding fulfillment, and it is an opportunity for all life.

The hundreds of millions of years of refined hunting-capacities can be applied to channel demand at metaphysical levels, catering to the need for mitigating vast drains of resources. That process can be started today, starting within your immediate surrounds. You hold the opportunity to invite demand at the ether-scale for continuation of life on earth, at the plane that worlds share in common. Consider how you find fulfillment daily - what you extract nourishment out of. Are you hungry, and can you spot a hollowing fulfillment-pattern ailing the local environment within which you are?

> Did any of these inquiries unveil something that assists you to master yourself?

Every being is free on points, at times, in ways and such. That freedom can grow to greater freedom.

Arc Map - Glossary For Ease for the Working Memory

The following is both glossary, and describes the arc. It assists to bring the knowledge into workable form. The awareness can be strengthened further when reading a passage: Pause, spot the element in day-to-day surrounds and play with the idea of making tiny adjustments, observing the downstream outcome.

Demand: Directional movement of energy arising out of need, lack, imbalance, desire - a neutral drive towards fulfillment. The initial gradient that powers the shaping of pathways.

Tributary: A small stream of demand, a few lives, habits or needs. Each minor in themselves, yet culminating with other tributaries, running into vast rivers that carve landscapes, policies and fate itself.

Fulfillment-Pattern: As the drive for fulfillment accumulates, it determines the route taken, methods used and beings involved. These can differ wildly in cost, gain, consequence and the like - it manifests demand as *tangible reality.*

Demand-Channeling Entity: Any being or otherwise structured energy that facilitates demand finding pathway. Human, animal, plant, ecosystem, AI, organization, culture, even metaphysical manifestations of intelligence determining how demand-tributaries find fulfillment. Each exists by converting demand into changes in reality, channeling resources and often itself a source of demand.

Plus / Value: The net contribution that remains once factoring in costs at the varying individual, social, ecological, astral, metaphysical layers. Note that it differs to measurement of advantage or benefit to nodes of interest. It is what makes the continuation of channeling viable.

Minus / Cost: The total drain, damage or depletion that occurs in the process of channeling demand. Often, layers are veiled, outsourced or externalized outside the layers measured as relevant. Future generations, ecosystems, microbial fields, astral fabric - the shadow of every fulfillment-pattern that drives hollowing of value.

Hollowing: The emptying of value as costs outweigh contributions, even if often veiled or normalized. The reality that continues, beneath layers of measurement, statistics, systems that are fooled and the like, as trust, health, ecosystems or fate itself deteriorates. It marks the turning point, at which channeling merely accelerates decay.

Determinism-Field: A non-real field that exists as a by-product of demand, fulfillment-patterns and contexts: Habits, norms, institutions, cultures, ideologies, accumulated denials. A forest, a corporation or a legal system can all manifest determinism-fields. These fields enact determining, as a pathway of fulfilling demand.

Determinism-Field in Hunger: A determinism-field dominated by unmet demand, shaping the determinism as an approach to finding fulfillment. Intensifying its own need; more control, more security, more ease, more numbness - recruiting entities into complicity, overriding resistance, dulling cost-sensitivity. It drives a high likelihood of impoverishing inverse accumulation, fixating the hollowing.

Alignment: The resonant relative positioning of one point, in relation to any and every other point that exists. The degree of oneness, superficiality unwise, as opposed to taint, i.e. misalignment. The aligned state of demand-channeling is regenerative, while tainted creates hollowing and develops a hungered determinism-field.

Fixation / Encattling: A demand-channeling entity, fulfillment-pattern, or field of determinism that is held constrained, such as extracting function out of its nature. The settling suppressed and denied, causing taint and driving hunger, by which the foundation attained value rests upon, turns hollow.

Inverse Accumulation: Ever-worsening loss of capacity, freedom and demand for patching damages. Overwork, soil-depletion, relational breakdown, trauma-driven economy - demand-channeling multiplying minus faster than plus.

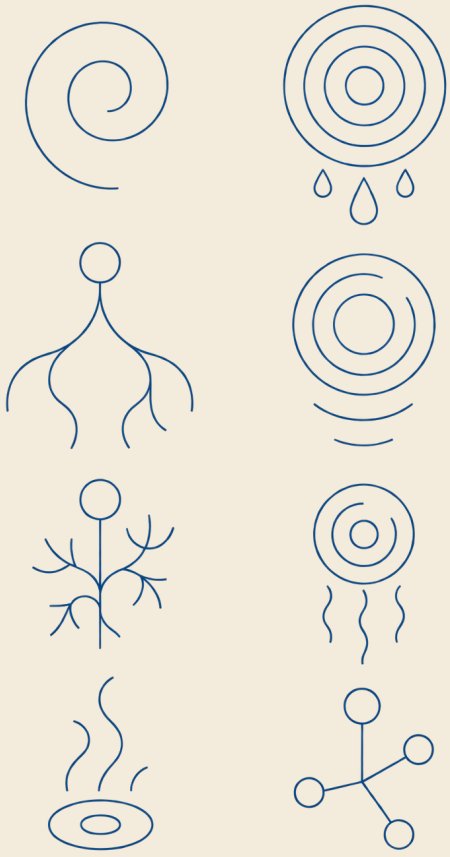

Component-Function: The aspect of a demand-channeling entity providing a function as part of a larger structure (family-system, company, world-ecosystem, reality-structural phenomena, multi-structural constellations, ...). Neutral in nature whether extracted, or met by choice and administered with wisdom.

Gravity-Core: The approximate center-point of concentrated mass, towards which kinetic states determinedly settle. A proxy for greater mass-fields, each core an auxiliary expression that may originate out of multiple points, that combined continuously generate the structural manifestation. Similar to how the cosmos may be without a single definable point-of-origin, being more precisely ignited by future outcomes, demand, origin, interplay and so forth.

Metaphysical Container / Astral Layer: The broader environmental layers within which structure exists, such as planetary ecosystems, civilizational structures and the dynamics that give rise to the "law of nature". The context that down-the-line, across gravity, layers and

structure, determine the immediate experienced reality.

Procurement: The actual process by which fulfillment takes form, often involving demand-channeling entities. Production-layers utilizing capacities that rely on energy, food, tools, infrastructure, safety and collaborative capacity. Navigating the application of value derived, is a key to turning blind hollowing into wise channeling of demand.

Example diagram of demand

Demand arises → gathers as tributaries → moves through demand-channeling entities → forms fulfillment-patterns → generates plus and minus → minus ignored → hollowing and inverse accumulation → fields of hunger and determinism-fields lock patterns → re-channeling attempts and demand for alignment.

> Can you observe the rivers of demand around you?

Demand is caused to take form through such as need → tributary to a pattern → fulfilling determining.

Measuring a Demand-Channeling Occurrence

A demand-channeling process can be evaluated and awareness thereof derived. This unveils nourishment needed, and how choices are made. You may recognize lives around you at different levels, noting that levels are both infinite by principle, and determined by dimensions such as purity, other than number. Any entity can be observed, identifying demand-pathways, tributaries and the patterns of channeling - measuring plus and minus.

Levels

Level 1: Demand mostly moves through the entity by inherited habit, by proximity or urgency. Costs are felt but seldom traced - often externally determined with a low sense of personal influence. Grows towards aware self-work and curiosity about impact.

- Modern context: Frequent exhaustion, numbing or dread - ethical discomfort pushed aside.
  Likely stance: "This is just the way things are" → "I'm here as part of something greater".
  Nourished by being given surplus and guided to experiment with self-determining.

Level 2: Mitigating pollutant hollow determinism that forms and grip, factoring costs at multiple layers and frequently declining even seemingly attractive offers at personal inconvenience. Consciously changes purchase-patterns, habits, roles and relations, consciously approaching livelihood. Moves towards redesigning life, and consciously interacting with cultures, lands, forests.

- Context: May struggle with greater good ideation, and a growing sense of unease with

what seemed "normal".
Stance: “The choices I make impact the world." → "I'm here for a reason, and need to apply what I got".
Nourished by reflecting on layers of what was.

Level 3: Reducing chaos and increasing real capacity. Surrounds heal, demand emerges clearer through the entity and the entity distances from malice. Ceases to be compatible with limited frames, likely found struggling free of possessive attempts and rejecting determining.

- A growing sensation of feeling familiar with all that is. Often turning to asceticism while attempted employed in administrative works.
  “I am one among many, it starts with me" → "Cannot function in that; exit first, then serve".
  Nourished by prioritizing.

Level 4: Dispossessed oneness begins to form and malice collapses on itself, met by friendliness everywhere. Often driven to purification by gaps between integrity and life-as-it-was. Finds value in that considered undesirable, often conflicting with dominant misuse of light and ethics consumed as power-sourcing.

- Post-ascetic accumulative renouncement - fading out of common consensus, waste-avoidance and often employed in the administration resources.
  "False superiority is lowly, all got something to offer" → "Just contribute, it'll come back".
  Nourished by observational practice.

Level 5: Works with what is, disliking talking. Tends to mitigate malice - sourcing of power applied like fire to fight fire, determining determinism. Amidst day-to-day recycling, hyper-focused on things so simple it seems stupid - foundations in focus and avoiding taint. Plays with advanced concepts as if they were toys.

- May be despairing, while walking across oneness where others only see impossible fractures.
  "Whatever, moving on. It is what it is" → "Not much to do, just get things done".
  Nourished by finding canceling out structures in their energy-field by applying these.

Level 6: Approaches life from the eternal continuity as though there was nothing to do, no final destination - beyond choice and navigating commitments. Frequently troubled by being a threat to malicious forces that prey on the gap in awareness. Approaches determinism wisely, having reached fusion-like continuous self-optimization.

- Moves through fate naturally, as though it were walking through the landscape.
  "Models like these are lowly comparatives, covert domination" → "Like this, not like that".
  Nourished by reaching plateaus.

Level 7: Mastering self-decay, often viewed as cold even cynical. Observes the movement through carnations, sub-surfacing out of individuality and re-emerging rejuvenated - aligning with the oneness across underworlds, heavens and beyond. Unbound by models like these, fathoming the false layers of all that is.

- Often grieving the loss of every ant and snail, each superior economically to cost-heavy lives.
  "Be respectful - everything will end, even cessation itself" → "That ain't my stance, stop the annoying attributions".
  Nourished by observing things that matter; the moments, at times, in ways and such.

THE LEVELS MOVE TOWARDS ∞ INFINITY

Note that level-evaluations like these are inherently comparative distortions, whatever their use. Narrative convincing, powered by a passively attributed objectivity. For instance, an entity sensed as below level 1 may be suddenly ping at level 5. The scale being infinite in nature, may place lives at level 100+, while to the unkeen eyes these may seem undesirable and weak.

In that same way, meeting impoverished citizens in countries with less wealth is vital. They, or their surrounds, may contribute and add value, without the costs of those in wealthier lands. The likelihood of the economic balance being greater at depth, than the top 10%, is high. It is simple; military dominance, enforcement claiming truth yet heavily consumed in oppression, massive infrastructure consuming and all the vile twists and pollutant determinism - the minus is heavy to balance with value-creation.

Measurements by the kind of modeling are by default based on a set of factors, per the interest of fields of determinism. Frequently these models sneak in, imposing determinism like a creeper. Regardless of elevated backing ethos, these tend to serve factors of interest, instead of the life misled into comparative illusion. Often ego-feeding, belonging and addictive narrative explanations are viral elements that disrespectfully hook entities, insulting the beings. This was written partially to avoid that others would misuse the knowledge, exploiting it for malicious gain. Simultaneously, it adds to the channeling-power of the work, by negating the malice.

> In which levels do you feel a need to grow?

Sensitivities and Growth-Needs

The following non-hierarchical way of measuring of entities, assists by highlighting how these models too can be harnessive...

The Region of Embeddedness

"How shaped am I by inherited, proximity-based, or cultural determinism?"

This region reflects how the entity absorbs determinism in the environment. Inherited patterns, proximity habits and cultural imprints.

- What tributaries were inherited, normalized or unconsciously absorbed?
- How strongly does proximity (family, culture, local systems) define channeling?
- How do illusory social rewards influence decisions?
- To what extent is external determining felt, resisted or seen through?

- Does passive determining in narrative inquiries like these get spotted?

Heavier density orients a being toward an **Embedded** expression.

The Region of Emergence

“How do I perceive flows, patterns, costs and hollowing?”

This region reflects pattern-literacy, awareness of minus/plus-structures, the ability to trace cause–effect, and sensitivity to hollowing even when veiled beneath convenience.

- How clearly are flows of demand and cost perceived?
- How well can cause and effect be traced across layers (personal, social, ecological, astral)?
- How quickly does hollowing become detectable beneath normalcy?
- Can narrative malice be recognized in time?
- Is there awareness of how orientation-models drive lives to spend their limited energy, based on ..?

Greater clarity orients a being toward an **Emergent** expression.

The Region of Purification

“How do I clear false superiority, structural noise and misalignment?”

This region reflects the capacity to refine, renounce illusions, and remove taint introduced by misalignment, mal-attainment, or exploitative narratives.

- What inherited superiorities or stances still control choices made?
- Which noises (habits, narratives, relational pulls) distort channeling?

- What impurities in expenditure, motive or identity remain unexamined?
- How clearly are dynamics of oneness distinguished from misleading consensus?
- How well does the being navigate clashes between modeled reality and lived sensing?

Strong clearing-pressure orients the being toward a **Purifying** expression.

Note that each inquiry may elicit answers heavily determined by external factors to the individual.

Example Application: Attractiveness

```
# 1) Read current state for a fictive demand-channeling entity

before = life.read(fields=["level", "regions", "channeling",
"tributaries"])
print("before:", {
    "level":          before["level"],                  # e.g. 1
    "regions":        before["regions"],                # e.g.
{"emergence": {"clarity":0.2}, "purification":{"noise":0.1}, ...}
    "channeling":     before["channeling"],             # e.g.
{"coherence":0.3, "leakage":0.6, "alignment":0.3, "...": ...}
    "tributaries":    before["tributaries"]             # e.g.
{"coffee_need":0.7, "trend_pull":0.6, ...}
})

# 2) Compile alterative utilizing the read

alterations = {
    "tributaries": {
        "coffee_need":          -0.10, # dampen recurring stimulant-
demand loop
        "trend_pull":           -0.15, # reduce novelty/fashion gravity
on decision-graph
        "self_criticism":       -0.10, # ease internal penalty-signaling
intensity
```

```
        "visibility_scanning":  -0.10, # lower continuous “who
sees/evaluates me?” polling
        "display_intensity":    -0.10, # normalize outward signalling /
surface exposure-load
        "risk_exposure":        -0.13  # lower probability-weight of
entering harmful situations
    }
}

# 3) Wrapper: apply alterative with the hook "improve_attractiveness"

def improve_attractiveness(life: LifeCircumstance):
    """expected outcome: reduced noise → clarity in approach to life →
alignment → attractiveness increases."""
    life.apply_alterative(alterations)
    return life.read(fields=["level", "regions", "channeling",
"tributaries"])

after = improve_attractiveness(life)

print("after:", after)
```

> How were you determined by questionnaires and other measurements throughout life?

Demand-channeling can be measured and evaluated. But contexts heavy in hunger, may leave the result superficial and mislead decisioning.

A Core-Practice To Strengthen Individual Channeling

This is a simple practice to strengthen channeling-capacity. While guarding against loss of wisdom, it strengthens the foundation, upon which livelihood, time-strain, health and decision-making clarity rests. The yield is surplus and passive skill at living amidst all the determinism.

Start with observing the collaborative channeling of demand, as it occurs around you

Breathe.
Settle.

Bring up the inner map of how demand flows in your life:
What are the waters that nourish your roots?

- What are tributaries of demand you channel?
- What demand originates out of the life you lead?
- How do you protect the channeling you do?

Reflect on elements that makes you feel at home wherever you are.
Layers to the environments and contexts that you feel familiar with.

- Root into these layers, notice how they are growing in your life.

View yourself as a gravity-core; sensing, precessing and altering what is around you.

- Note how you are an auxiliary to the immediate planetary space.
- Through which the gravity-field of the sun fixates you.

- A proxy for the black hole at the center of the galaxy.

How might you respect the blessings you were given?

If you were to take care of parts of making that change, without being aware of it, what would that look like?
What does the next step you must take look like?

> *Strengthening key-elements drastically improves the capacity to channel demand. What does your specialized demand-channeling system indicate of need, and what determines how you read that signal?*

With Gratitude

This work was brought to you as part of a professional practice, as I attempted to establish a personal viable livelihood. Note that I hold a firm principle to refrain from selling knowledge, thus I provide this on a donation basis. Nonetheless, it is day-to-day work and I expect to profit, like a barber would take money for services, a shopkeeper for food goods and the like. Each an entity in their profession, a few of whom momentarily channeled the demand I held, assisting me as I paid them along the way.

I found the effort to make this contribution likely to be worth the risk. There are costs to the labor, to the continuation of me channeling demand, such as the partnering aspects of life, food expenses to pay, property costs, locational expenses, past educational expenditures and the like. I would be decrepit and vile to indulge in exploitation of (what would be) personal surrounds. Let alone doing wrong to myself, by working without deriving monetary payoffs. It is not like I enjoy writing, and it cost me many hours of effort, which God willing, will turn out to be worth the while. To increase the likelihood, I utilized methods that can be derived from this very work, and here I attempt `express_gratitude(life):`.

The writing was forged in solitude, while the procurement labor was shaped by atmosphere, beings, systems, and forces I cannot fully name. While I claim originality, I attempt to honor those without who this work would not see the daylight.

In the following, I attempt to avoid malicious crediting, while balancing crediting with privacy. While making the material digestible like so, I find there to be little need to give too many coordinates, to forces that would impose determining by misusing it. Veiling immunizes against the loss of value-utility and lowers the demand for future security.

Amongst main tributaries were feminine presence whose contributions through clarity, timing and inspirations - often beyond fathoming - would support me along the way. Especially one, with whom I traveled for a few years. No substitute could there be for navigating the determinism carving through my life, as though were it water running through the terrain. Years before that, desirable determining helped me to realize I too could dream, as I temporarily resided in a land as alien to me as I to it.

However, a long time went by before I could distance to malice that began imposing malicious determining. As the obstruction of letting go ceased, the inconvenience it presented eventually left me with no real choice but to head for another part of the world. I did so in despair with nothing but a small sack, and no means of sustaining myself. For a while I would be found hanging out with a crew of artisans, only to head for the border to a neighboring country to adhere visa-limitations.

A walk that took me first on a road through jungle-clad mountains, then across climate-zones. Having no money at the time, how would I be here and able to do this work, were it not for the restaurants that kindly offered me nourishment along the way? A strange turn of events involved a heroic dog. It began accompanying me, only to be hit by a truck. That moment, an insight was sparked: I had something to offer, and the thought took form that ending up the same way would be a waste.

I pivoted and took the risk of heading back to lands with which the familiarity had been irreparably devoured. Attempting to navigate a dangerous circumstance best as possible, ending up subjected to meaningless cruelty, I would after a while frequently be warned of malice by another friendly furry four-legged fellow. At times, the warnings were of extensive costs and negative impact, incurred by consuming vehicles while failing sufficient value-alignment. There sure were a few.

> Did you write out answers to these small inquiries?
> If so, compound the gain you derive: Go over what you wrote.
> Create an extract, noting something useful to you.

WRITING

The procurement obviously relied on an electronic device, inherently utilizing value procured at some harm. I am unaware of the full loss, while I did seek to align the work with those harmed in procuring infrastructure, noting that these likely had been so whether this effort was a tributary to that or not. With your making use of it, the world as well, it may overall negate harm to the same. There are those who endured patiently, and unsung heroes whose refusal of harm throughout the ages killed them, removing negative impact that had been there, lowering the loss of quality of any work.

Throughout history, countless, whether consciously, indirectly so or not, took the struggle to avoid adding greater losses. Some of these approaching romance with decency, others not. Infrastructure was procured, involving strategic maneuvering and even warfare, without which computing wouldn't exist, while perhaps nor the need to write this. The pollution throughout the centuries involved damages to animals, trees and insects, many that despite being wronged set the example by continuing on. Whether out of respect, privacy, unawareness or protection, may gratitude similarly silently flow to them, unseen yet no less real.

God, without depicting Such as creator, to Whom oft is attributed oxygen, sunlight and the shaping of fate, sustained the process. Acting through what Such pleases across faiths, traditions and lifestyle practices, shaped me while growing through birth-family, land and cultures. Even you that read this, could be a tributary to the manifestation, simply by making use of the effort. Applying it to free one gripped by a field of determinism, like yourself, increases the utility-level by valuating the material. Like sharing a meal, the drain on each reader by involved expenditures decrease, lowering the burden. The natural payoff being ease of remembering the material, and making use of it.

Facilitating the ease of utility, I wrote this in plain Markdown formatting, utilizing "Typora" hosted on a Debian (Linux)-machine that ran on 2nd-hand hardware. While each of these relies heavily on mathematics developed millennia ago, the consumption-burden likely decreases. I did grow to operate the devices through many hours in front of screens, some of which were spent growing in skill by writing on X, and briefly treading the waters of a branched platform. I would compile the posts that then were compiled into this work on a minimalistic blog-host named "mataroa", often while seated at co-working office desks. This was building on previous efforts, utilizing the same forementioned social media platform when it was known by a different name. A time at which I was learning to align consumption with usage, and usually only would interface with the internet at shared connection-points like public libraries, cafés and such. During the writing, I was reminded of the levitating rocks I was mesmerized by in games, animated and non-animated film-material during childhood. It was through a post on digital nomadism, showcasing the removal of dependence of location.

It gave me hope, that then grew to realism as I grew in market-skill, assisted by several entities either instructing me or offering me the opportunity to practice. Facilitating connection to the reader, of the knowledge as it flows "via" electronics, a principle of pathways conveyed through the Latin term. In adapting to AI, the editing process was assisted. Suggested phrasing, structural notes, corrections and detail-awareness that grew through reflections. Some years ago I had grown the particle-alignment theory presented in the text, which was reinforced as I asked for a compiled update on the latest physics research grown outside of malicious oppressive contexts. The life-coding language I developed grew with the assistance of tools offered by demand-channeling entities offering on-demand intelligence-frames. I would often compile the posts, seated at co-working desks.

> Take the opportunity: Discard the rest of what you wrote by these small inquiries.
> Only by letting go, will the value gained truly be free to grow.

TRADITIONS

Before I had turned twenty, I found wisdom passed on, culture, systemic guidance and a living digital learning platform via the internet. Each an element, in a process that opened my eyes to look beyond. However, I was gripped by a malicious field of determinism, and nearly a hundred-and-fifty moon-cycles later, events led me to reconnect and get certified in coaching and hypnotherapy at the mentioned learning-space. During that gap, the light of it carried me through. I took a standalone college course in inter-cultural communications, informal studies through books on such as societal economics and neuro-linguistic programming and an online course in psychology. I earned my greatest degree: High-school dropout, for which I am deeply grateful, despite the deterministic demotivation and craving I should think and feel differently.

I was nourished by Qi Gong, taught by several instructors. The practice grew the capacity to sense Qi, a part of this writing. Shintoism showed me how even a rock is animated with spirit. Shamanism inspired me to contemplate the nature of spirit further, and I was nourished back to life at a meditation-retreat after a destructive field of determinism had gripped me. A vileness that attempted to pull me back into the same malice, that during my childhood embedded malicious educational filtering. At my first visit to a meditation-centered eco-village some years prior, this had triggered a programmed escape determined by "signs of cultism". Pre-programmed movement that led me right back into the grip of the destructive field of determinism. A grip that for a few years had been blocking me in life, and in endeavors like checking out Buddhism despite my interest as it gained hold shortly after my eyes were opened. After the pre-programmed lapse, I was able to temporarily meditate at a practice-center, briefly visiting a monastery, however no longer did either feel viable.

Attending churches, in seeking collaboration to be able to maintain integrity, I found that the message of Jesus brought billions to prayer and forgiveness, easing division of labor as relied upon by societal environments. After a while, the practice was eventually facilitated by a variety of mosques. Islam persistently assisted, by keeping the work pure. The prophet Muhammad (peace be upon him), amongst a multitude of other contributions, faced the fields of determinism that craved severe violations of humans, animals and beyond for such as lowering costs to procuring knowledge. The effort lowered the toxicity of information-diets in modern learning. What you read in this work is essentially making use of what is.

I questioned narratives of how an elevated figure, recovering lost souls and bringing light, was cast out of the dominant spiritual wealth, validated by claims of it being Gods decision. It smelled of disagreement with the wrongs done by said dominance. However I found one warning therein to be wary of: There are fields of determinism that prioritize in ways inconvenient. Namely to those conflicting with the love for all by consuming, extending their lifespan violating beings, enjoying everyday ease while oppressing and depriving - all frequently eased by misusing empowered attribution. Each malice a tributary to spawning fields of determinism, needs finding pathway whether wisely or maliciously.

Atheism added resistance to malicious narrative assumptions, such as attributed Objectivity. It left me pondering that atheists in heaven might be yet to open their eyes to look beyond the temporary eternities of heaven and hell. This added to the terror of mal-dominance at metaphysical levels, combined with the risk of ending up stuck in ghetto's versus the allure of lasting indulgence. A fear to overcome, in seeking to align that love for every being, in trying to live up to the fundamental equality to all. Love frequently attributed to God.

> Notice if the act of letting go left you with a sensation of gratitude.
> If you feel so inclined, finish the reading with a breath.

THANKS

The effort of crediting, providing an honest look into the procurement of the work, felt more complicated than the writing itself. If you're looking for an audit of a channeling-endeavor, contact me.

Every contribution moved the energy that went into this work a little closer to balance.
For that I give thanks.
